

Why have GPUs Been Outpacing CPUs in Performance? 7

Another reason is that general CPU chips contain on-chip logic to do **branch prediction** and **out-of-order execution**. This, too, takes up chip die space.

But, CPU chips can handle more general-purpose computing tasks.

So, which is better, a CPU or a GPU?

It depends on what you are trying to do!

Dregon State University Computer Graphics mp - May 5, 2020

7

Originally, GPU Devices were very task-specific 8

Dregon State University Computer Graphics mp - May 5, 2020

8

Today's GPU Devices are much less task-specific 9

Dregon State University Computer Graphics mp - May 5, 2020

9

Consider the architecture of the NVIDIA Tesla V100's that we have in our GDx System 10

84 Streaming Multiprocessors (SMs) / chip
64 cores / SM
Wow! 5,396 cores / chip? Really?

Dregon State University Computer Graphics mp - May 5, 2020

10

What is a "Core" in the GPU Sense? 11

Look closely, and you'll see that NVIDIA really calls these "CUDA Cores"

Look even more closely and you'll see that these CUDA Cores have no control logic – they are **pure compute units**. (The surrounding SM has the control logic.)

Other vendors refer to these as "Lanes". You might also think of them as 64-way SIMD.

Transistors	7.1 billion	8 billion	15.3 billion	21.1 billion
GPU Die Size	351 mm ²	601 mm ²	610 mm ²	815 mm ²
Manufacturing Process	28 nm	28 nm	16 nm FinFET+	12 nm FinFET

Oregon State University Computer Graphics

14

The Bottom Line is This

So, the Titan Xp has 30 processors per chip, each of which is optimized to do 128-way SIMD. This is an amazing achievement in computing power. But, it is obvious that it is difficult to *directly* compare a CPU with a GPU. They are optimized to do different things.

So, let's use the information about the architecture as a way to consider what CPUs should be good at and what GPUs should be good at

CPU	GPU
General purpose programming	Data parallel programming
Multi-core under user control	Little user control
Irregular data structures	Regular data structures
Irregular flow control	Regular Flow Control

BTW, The general term in the OpenCL world for an SM is a **Compute Unit**. The general term in the OpenCL world for a CUDA Core is a **Processing Element**.

Oregon State University Computer Graphics

15

Compute Units and Processing Elements are Arranged in Grids

A GPU Platform can have one or more Devices.

A GPU Device is organized as a grid of Compute Units.

Each Compute Unit is organized as a grid of Processing Elements.

So in NVIDIA terms, their new V100 GPU has 84 Compute Units, each of which has 64 Processing Elements, for a grand total of 5,396 Processing Elements.

Oregon State University Computer Graphics

16

Thinking ahead to CUDA and OpenCL...

How can GPUs execute General C Code Efficiently?

- Ask them to do what they do best. Unless you have a very intense **Data Parallel** application, don't even think about using GPUs for computing.
- GPU programs expect you to not just have a few threads, but to have **thousands** of them!
- Each thread executes the same program (called the **kernel**), but operates on a different small piece of the overall data
- Thus, you have many, many threads, all waking up at about the same time, all executing the same kernel program, all hoping to work on a small piece of the overall problem.
- OpenCL has built-in functions so that each thread can figure out which thread number it is, and thus can figure out what part of the overall job it's supposed to do.
- When a thread gets blocked somehow (a memory access, waiting for information from another thread, etc.), the processor switches to executing another thread to work on.

Oregon State University Computer Graphics

17

So, the Trick is to Break your Problem into Many, Many Small Pieces

Particle Systems are a great example.

1. Have one thread per *each particle*.
2. Put all of the initial parameters into an array in GPU memory.
3. Tell each thread what the current **Time** is.
4. Each thread then computes its particle's position, color, etc. and writes it into arrays in GPU memory.
5. The CPU program then initiates OpenGL drawing of the information in those arrays.

Note: once setup, the data never leaves GPU memory!
