Texture-mapping starts with an interesting image

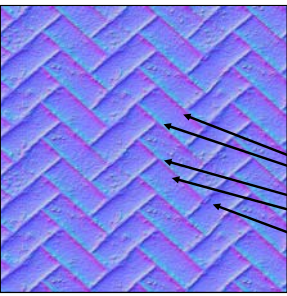

Let's say that we want to do bump-mapped displacements with these bricks. For certain types of textures, like this one, you could write a program to examine the texture texel-by-texel and come up with an approximate normal vector at each texel and then encode this into another texture image. This is called a **normal map**.

3

Getting the normals by analyzing the texture – the Normal Map

Red : nx
Green : ny
Blue : nz

Much red: nx - +1.
No red: nx - -1.
Much green: ny - -1.
No green: ny - +1.
Much blue: nz - +1.

Interpreting this image is a little tricky. Normal vector components run from -1. to +1. But, color channels run from 0. to 1. So, a color value of 0. is needed to correspond to a normal component of -1., and a color value of 1. is needed to correspond to a normal component of +1. In this case, green is encoded upside-down.

Original Texture Map and Normal Texture Map

5

We can use the color texture image on top of a surface

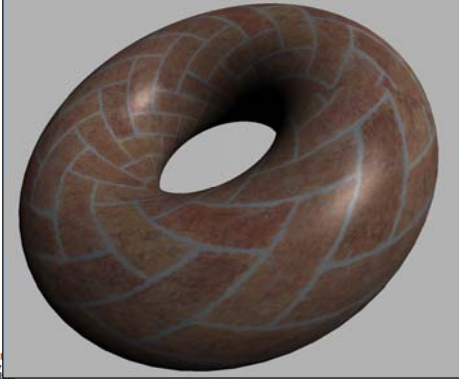

↑
Geometry you are displaying

6

And then you get something like this

7

But, what if the surface really has displacements, but you would only see them if you were using more geometric detail?

Geometry you are displaying

What you really have

8

Even turning on texture-mapping only puts the flat texture on the flat surface

9

We could get the normals from the normal map and perform bump-mapping

Oregon State University Computer Graphics

mb - February 25, 2020

10

That is good, but . . .

11

. . . we can do even better – Parallax Mapping

Geometry you are displaying

4

2

. . . it should be displaying this one

. . . it displays this texture color.

When the eye looks here . . .

3

1

But if the displacements were really here, . . .
