2

Preliminary Background – the OpenGL *Rendering Context*

The OpenGL Rendering Context contains all the characteristic information necessary to produce an image from geometry. This includes transformations, colors, lighting, textures, where to send the display, etc.

Some of these characteristics have a default value (e.g., lines are white, the display goes to the screen) and some have nothing (e.g., no textures exist)

Oregon State University
Computer Graphics

2

3

More Background – What is an OpenGL “Object”?

An OpenGL Object is pretty much the same as a C, C++, C#, or Java object: it encapsulates a group of data items and allows you to treat them as a single whole. For example, a Texture Object could be created in C++ by:

```
class TextureObject
{
    enum minFilter, maxFilter;
    enum storageType;
    int numComponents;
    int numDimensions;
    int numS, numT, numR;
    void *image;
};
```

Then, you could create any number of Texture Object instances, each with its own characteristics encapsulated within it. When you want to make that combination current, you just need to bring in (“bind”) that entire object. You don’t need to deal with the information one piece of information at a time.

3

4

More Background – How do you Create an OpenGL “Object”?

In C/C++, objects are pointed to by their address.

In OpenGL, objects are pointed to by an unsigned integer handle. You can assign a value for this handle yourself (not recommended), or have OpenGL generate one for you that is guaranteed to be unique. For example:

```
GLuint texA;
glGenTextures( 1, &texA );
```

This doesn’t actually allocate memory for the texture object yet, it just acquires a unique handle. To allocate memory, you need to bind this handle to the Context.

Oregon State University
Computer Graphics

mjb - December 20, 2020

4

5

More Background -- "Binding" to the Context

The OpenGL term "binding" refers to "docking" (a Star Trek-ish metaphor which I find to be more visually pleasing) an OpenGL object to the Context. You can then assign characteristics, and they will "flow" through the Context into the object.

```

gBindTexture( GL_TEXTURE_2D, texA );
glTexParameterf( GL_TEXTURE_2D, GL_TEXTURE_WRAP_S, GL_REPEAT );
glTexParameterf( GL_TEXTURE_2D, GL_TEXTURE_WRAP_T, GL_REPEAT );
glTexParameterf( GL_TEXTURE_2D, GL_TEXTURE_MAG_FILTER, GL_LINEAR );
glTexParameterf( GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER, GL_LINEAR );
glTexImage2D( GL_TEXTURE_2D, 0, GL_RGBA, dimS, dimT, 0, GL_RGBA,
              GL_UNSIGNED_BYTE, image );
  
```

Memory for the object is allocated the first time the handle goes through the bind process.

mjb - December 20, 2020

5

6

More Background -- "Binding" to the Context

When you want to use that Texture Object, just bind it again. All of the characteristics will then be active, just as if you had specified them again.

```

glActiveTexture( GL_TEXTURE0 );
glBindTexture( GL_TEXTURE_2D, texA );
  
```

mjb - December 20, 2020

6

7

The Overall Render-to-Texture Process

- 1 You will be changing the Display Destination. Generate a handle for a Framebuffer Object. Generate handles for one (depth) Renderbuffer Object and for one (color) Texture Object. (These will later be attached to the Framebuffer Object)
- 2 Bind the Framebuffer Object to the Context, thus un-binding the display monitor
- 3 Bind the Depth Renderbuffer Object to the Context
Assign storage attributes to it
Attach it to the Framebuffer Object
- 4 Bind the Color Texture Object to the Context
Assign storage attributes to it
Assign texture parameters to it
Attach it to the Framebuffer Object
- 5 Render as normal
- 6 Un-bind the Framebuffer Object from the Context, thus re-binding the display monitor

mjb - December 20, 2020

7

8

Code for the Render-to-Texture Process

```

In InitGraphics( ), generate a FrameBuffer handle, a RenderBuffer handle, and a Texture handle:
GLuint FrameBuffer;
GLuint DepthBuffer;
GLuint Texture;

glGenFramebuffers( 1, &FrameBuffer );
glGenRenderbuffers( 1, &DepthBuffer );
glGenTextures( 1, &Texture );

Setup the size you want the texture rendering to be (this can be larger than the display window or even the display monitor):
int sizeS = 2048;
int sizeT = 2048;

Bind the offscreen framebuffer to be the current output display:
glBindFramebuffer( GL_FRAMEBUFFER, FrameBuffer );

Bind the Depth Buffer to the context, allocate its storage, and attach it to the current Framebuffer:
glBindRenderbuffer( GL_RENDERBUFFER, DepthBuffer );
glRenderbufferStorage( GL_RENDERBUFFER, GL_DEPTH_COMPONENT, sizeS, sizeT );
glFramebufferRenderbuffer( GL_FRAMEBUFFER, GL_DEPTH_ATTACHMENT, GL_RENDERBUFFER, DepthBuffer );
  
```

mjb - December 20, 2020

8

Code for the Render-to-Texture Process

9

Bind the Texture to the Context:

```
glBindTexture( GL_TEXTURE_2D, Texture );
```

Setup a NULL texture of the size you want to render into and set its properties:

```
glTexImage2D( GL_TEXTURE_2D, 0, 4, sizeS, sizeT, 0, GL_RGBA, GL_UNSIGNED_BYTE, NULL );
glTexParameteri( GL_TEXTURE_2D, GL_TEXTURE_WRAP_S, GL_CLAMP );
glTexParameteri( GL_TEXTURE_2D, GL_TEXTURE_WRAP_T, GL_CLAMP );
glTexParameteri( GL_TEXTURE_2D, GL_TEXTURE_MAG_FILTER, GL_LINEAR );
glTexParameteri( GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER, GL_LINEAR );
```

Tell OpenGL that you are going to render into the color planes of the Texture (we've already done this to the depth buffer):

```
glFramebufferTexture2D( GL_FRAMEBUFFER, GL_COLOR_ATTACHMENT0, GL_TEXTURE_2D, Texture, 0 );
```

Check to see if OpenGL thinks the framebuffer is complete enough to use:

```
GLenum status = glCheckFramebufferStatus( GL_FRAMEBUFFER );
if( status != GL_FRAMEBUFFER_COMPLETE )
    fprintf( stderr, "FrameBuffer is not complete.\n" );
```

Oregon State University
Computer Graphics

mjb - December 20, 2020

9

Code for the Render-to-Texture Process

10

Now, render as you normally would. Be sure to set the viewport to match the size of the color and depth buffers:

```
glClearColor( 0., 0., 0., 1. );
glClear( GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT );
glEnable( GL_DEPTH_TEST );
glShadeModel( GL_SMOOTH );
glViewport( 0, 0, sizeS, sizeT );

glMatrixMode( GL_PROJECTION );
glLoadIdentity( );
gluPerspective( 90., 1., 0.1, 1000. );

glMatrixMode( GL_MODELVIEW );
glLoadIdentity( );
gluLookAt( 0., 0., 3., 0., 0., 0., 0., 1., 0. );

glRotatef( RotY, 0., 1., 0. );
glRotatef( RotX, 1., 0., 0. );
glScalef( Scale, Scale, Scale );
glColor3f( 1., 1., 1. );

glutWireTeapot( 1. );
```

Tell OpenGL to go back to rendering to the display monitor:

```
glBindFramebuffer( GL_FRAMEBUFFER, 0 );
```

Oregon State University
Computer Graphics

mjb - December 20, 2020

10

Code for the Render-to-Texture Process

11

Now, render the second pass of the scene as normal, mapping the Texture onto a quadrilateral:

```
glClearColor( 0., 0., 0., 1. );
glClear( GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT );
glEnable( GL_DEPTH_TEST );
glShadeModel( GL_FLAT );
glViewport( 0, 0, v, v );

glMatrixMode( GL_PROJECTION );
glLoadIdentity( );
gluOrtho2D( -1., 1., -1., 1. );

glMatrixMode( GL_MODELVIEW );
glLoadIdentity( );

glEnable( GL_TEXTURE_2D );
glBindTexture( GL_TEXTURE_2D, Texture );
glBegin( GL_QUADS );
    glTexCoord2f( 0., 0. );
    glVertex2f( -1., -1. );
    glTexCoord2f( 1., 0. );
    glVertex2f( 1., -1. );
    glTexCoord2f( 1., 1. );
    glVertex2f( 1., 1. );
    glTexCoord2f( 0., 1. );
    glVertex2f( -1., 1. );
glEnd();

glDisable( GL_TEXTURE_2D );

...

```

18

A Slight Variation: Render-to-Offscreen-Framebuffer Memory

19

- 1 You will be changing the Display Destination. Generate a handle for a Framebuffer Object. Generate handles for two (color+depth) Renderbuffer Objects. (These will later be attached to the Framebuffer Object)
- 2 Bind the Framebuffer Object to the Context
- 3 Bind the Depth Renderbuffer Object to the Context
Assign storage attributes to it
Attach it to the Framebuffer Object
- 4 Bind the Color Renderbuffer Object to the Context
Assign storage attributes to it
Attach it to the Framebuffer Object
- 5 Render as Normal
- 6 Un-bind the Framebuffer Object from the Context

mjb - December 20, 2020

19

Code for the Render-to-Offscreen-Framebuffer Process

20

```

In InitGraphics( ), generate Framebuffer and Renderbuffer handles:

GLuint FrameBuffer;
GLuint ColorBuffer;
GLuint DepthBuffer;

glGenFramebuffers( 1, &FrameBuffer );
glGenRenderbuffers( 1, &ColorBuffer );
glGenRenderbuffers( 1, &DepthBuffer );

Setup the size you want the off-screen rendering to be :

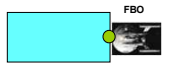

int sizeS = 2048;
int sizeT = 2048;

You will reference these sizes a few times, so it is a good idea to use variables for
the sizes and not hardcode them as numbers in function calls !

Bind the offscreen framebuffer to be the current output display:

glBindFramebuffer( GL_FRAMEBUFFER, FrameBuffer );

```

mjb - December 20, 2020

20

21

Code for the Render-to-Offscreen-Framebuffer Process

Bind the Depth Buffer to the context, allocate its storage, and attach it to the Framebuffer:

```
glBindRenderbuffer( GL_RENDERBUFFER, DepthBuffer );
glRenderbufferStorage( GL_RENDERBUFFER, GL_DEPTH_COMPONENT, sizeS, sizeT );
glFramebufferRenderbuffer( GL_FRAMEBUFFER, GL_DEPTH_ATTACHMENT, GL_RENDERBUFFER, DepthBuffer );
```

Bind the Color Buffer to the context, allocate its storage, and attach it to the Framebuffer:

```
glBindRenderbuffer( GL_RENDERBUFFER, ColorBuffer );
glRenderbufferStorage( GL_RENDERBUFFER, GL_RGBA, sizeS, sizeT );
glFramebufferRenderbuffer( GL_FRAMEBUFFER, GL_COLOR_ATTACHMENT0, GL_RENDERBUFFER, ColorBuffer );
```

The diagram illustrates three stages of FBO setup. In the first, a Depth RBO is attached to the FBO. In the second, a Color RBO is also attached. In the third, both are attached, and the FBO is shown as a complete unit.

Check to see if OpenGL thinks the framebuffer is complete enough to use:

```
GLenum status = glCheckFramebufferStatus( GL_FRAMEBUFFER );
if( status != GL_FRAMEBUFFER_COMPLETE )
    fprintf( stderr, "Framebuffer is not complete.\n" );
```

Oregon State University
Computer Graphics
mjb - December 20, 2020

21

22

Code for the Render-to-Offscreen-Framebuffer Process

Now, render as you normally would. Be sure to set the viewport to match the size of the color and depth buffers:

```
glClearColor( 0.0, 0.2, 0.0, 1. );
glClear( GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT );
glEnable( GL_DEPTH_TEST );
glShadeModel( GL_FLAT );
glViewport( 0, 0, sizeS, sizeT );

glMatrixMode( GL_PROJECTION );
glLoadIdentity();
gluPerspective( 90., 1.0, 1, 1000. );

glMatrixMode( GL_MODELVIEW );
glLoadIdentity();
gluLookAt( 0., 0., 3., 0., 0., 0., 0., 1., 0. );

glTranslatef( TransXYZ[0], TransXYZ[1], TransXYZ[2] );
glMultMatrixf( RotMatrix );
glScalef( scale, scale, scale );
glColor3f( 1., 1., 1. );

glutWireTeapot( 1. );
```

Oregon State University
Computer Graphics
mjb - December 20, 2020

22

23

Code for the Render-to-Offscreen-Framebuffer Process

Read the pixels back and do something with them (such as writing an image file):

```
unsigned char *image = new unsigned char [ 3*sizeS*sizeT ];
glPixelStorei( GL_PACK_ALIGNMENT, 1 );
glReadPixels( 0, 0, sizeS, sizeT, GL_RGB, GL_UNSIGNED_BYTE, image );
...
```

Tell OpenGL to go back to rendering to the display monitor:

```
glBindFramebuffer( GL_FRAMEBUFFER, 0 );
```

The dialog box has a 'Y Resolution' dropdown menu set to '1024', a 'Create Hardcopy File' button, and a 'Display the Hardcopy File [^D]' button. A red arrow points to the 'Y Resolution' dropdown.

Render-to-Framebuffer is *great* for creating arbitrary-resolution hardcopy!
