Telling the Pipeline about its Input

We will come to the Pipeline later, but for now, know that a Vulkan pipeline is essentially a very large data structure that holds (what OpenGL would call) the **state**, including how to parse its input.

```c
struct vertex
{

    glm::vec3 normal;
    glm::vec3 color;
    glm::vec2 texCoord;
};
```

```c
layout( location = 0 ) in vec3 aVertex;
layout( location = 1 ) in vec3 aNormal;
layout( location = 2 ) in vec3 aColor;
layout( location = 3 ) in vec2 aTexCoord;
```

```c
VkVertexInputBindingDescription vvibd[1];  // one of these per buffer data buffer
    vvibd[0].binding = 0;   // which binding # this is
    vvibd[0].stride = sizeof( struct vertex );  // bytes between successive structs
    vvibd[0].inputRate = VK_VERTEX_INPUT_RATE_VERTEX;
```

Telling the Pipeline about its Input

We will come to the Pipeline later, but for now, know that a Vulkan Pipeline is essentially a very large data structure that holds (what OpenGL would call) the state, including how to parse its input.

```c
VkGraphicsPipelineCreateInfo vgpci;
    vgpci.sType = VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO;
    vgpci.pNext = nullptr;
    vgpci.flags = 0;

We will come to Command Buffers later, but for now, know that you will specify the vertex buffer that you want drawn.

```c
VkBuffer buffers[1] = MyVertexDataBuffer.buffer;

vkCmdBindVertexBuffers( CommandBuffers[nextImageIndex], 0, 1, vertexDataBuffers, offsets );

const uint32_t vertexCount = sizeof( VertexData ) / sizeof( VertexData[0] );
const uint32_t instanceCount = 1;
const uint32_t firstVertex = 0;
const uint32_t firstInstance = 0;

vkCmdDraw( CommandBuffers[nextImageIndex], vertexCount, instanceCount, firstVertex, firstInstance );
```
Drawing with an Indexed Buffer

vkCmdBindVertexBuffers(commandBuffer, firstBinding, bindingCount, vertexDataBuffers, vertexOffsets);

vkCmdBindIndexBuffer(commandBuffer, indexDataBuffer, indexOffset, indexType);

typedef enum VkIndexType
{
    VK_INDEX_TYPE_UINT16 = 0, // 0 – 65,535
    VK_INDEX_TYPE_UINT32 = 1, // 0 – 4,294,967,295
} VkIndexType;

vkCmdDrawIndexed(commandBuffer, indexCount, instanceCount, firstIndex, vertexOffset, firstInstance);
Indirect Drawing

```
vkCmdDrawIndirect(commandBuffer, buffer, offset, drawCount, stride);
```

typedef struct
    VkDrawIndirectCommand
{
    uint32_t    vertexCount;
    uint32_t    instanceCount;
    uint32_t    firstVertex;
    uint32_t    firstInstance;
} VkDrawIndirectCommand;

Compare this with:

```
vkCmdDraw(CommandBuffers[nextImageIndex], vertexCount, instanceCount, firstVertex, firstInstance);
```
Indexed Indirect Drawing

```c
vkCmdDrawIndexedIndirect( commandBuffer, buffer, offset, drawCount, stride );
```

```c
typedef struct
VkDrawIndexedIndirectCommand
{
    uint32_t    indexCount;
    uint32_t    instanceCount;
    uint32_t    firstIndex;
    int32_t     vertexOffset;
    uint32_t    firstInstance;
} VkDrawIndexedIndirectCommand;
```

Compare this with:

```c
vkCmdDrawIndexed( commandBuffer, indexCount, instanceCount, firstIndex, vertexOffset, firstInstance);
```
Sometimes a point that is common to multiple faces has the same attributes, no matter what face it is in. Sometimes it doesn’t.

A color-interpolated cube like this actually has both. Point #7 above has the same color, regardless of what face it is in. However, Point #7 has 3 different normal vectors, depending on which face you are defining. Same with its texture coordinates.

Thus, when using index-ed buffer drawing, you need to create a new vertex struct if any of {position, normal, color, texCoords} changes from what was previously-stored at those coordinates.
The OBJ File Format – a triple-indexed way of Drawing

Note: The OBJ file format uses **1-based** indexing for faces!
