Instancing
Instancing – What and why?

- Instancing is the ability to draw the same object multiple times
- It uses all the same vertices and graphics pipeline each time
- It avoids the overhead of the program asking to have the object drawn again, letting the GPU/driver handle all of that

```cpp
vkCmdDraw(CommandBuffers[nextImageIndex], vertexCount, instanceCount, firstVertex, firstInstance);
```

But, this will only get us multiple instances of identical objects drawn on top of each other. How can we make each instance look differently?
Making each Instance look differently -- Approach #1

Use the built-in vertex shader variable `gl_InstanceIndex` to define a unique display property, such as position or color.

`gl_InstanceIndex` starts at 0

In the vertex shader:

```cpp
int NUMINSTANCES = 16;
float DELTA = 3.0;

float xdelta = DELTA * float( gl_InstanceIndex % 4 );
float ydelta = DELTA * float( gl_InstanceIndex / 4 );
vColor = vec3( 1., float( (1.+gl_InstanceIndex) ) / float( NUMINSTANCES ), 0. );

xdelta -= DELTA * sqrt( float(NUMINSTANCES) ) / 2.;
ydelta -= DELTA * sqrt( float(NUMINSTANCES) ) / 2.;
vec4 vertex = vec4( aVertex.xyz + vec3( xdelta, ydelta, 0. ), 1. );

gl_Position = PVM * vertex;
```
Put the unique characteristics in a uniform buffer and reference them

Still uses `gl_InstanceIndex`

In the vertex shader:

```glsl
layout( std140, set = 3, binding = 0 ) uniform colorBuf
{
    vec3 uColors[1024];
} Colors;

out vec3 vColor;

    ...

int index = gl_InstanceIndex % 1024;        // 0 - 1023
vColor = Colors.uColors[ index ];
gl_Position = gl_ModelViewProjectionMatrix * gl_Vertex;
```
Making each Instance look differently -- Approach #3

Put a series of unique characteristics in a data buffer, one element per instance.

Read a new characteristic for each instance

Internally uses `gl_InstanceIndex`, but you don’t
This is just the Vertex Input State Portion of the Graphics Pipeline Structure
VkVertexInputBindingDescription *vvibd[1];
    // an array containing one of these per buffer being used
    vvibd[0].binding = 0;           // which binding # this is
    vvibd[0].stride = sizeof(struct vertex);              // bytes between successive
    vvibd[0].inputRate = VK_VERTEX_INPUT_RATE_VERTEX;

This definition says that we should advance through the input buffer by this much every time we hit a new vertex.
 VkVertexInputAttributeDescription vviad[4];
    // an array containing one of these per vertex attribute in all bindings
    // 4 = vertex, normal, color, texture coord
    vviad[0].location = 0;       // location in the layout decoration
    vviad[0].binding = 0;        // which binding description this is part of
    vviad[0].format = VK_FORMAT_VEC3;       // x, y, z
    vviad[0].offset = offsetof( struct vertex, position );   // 0

    vviad[1].location = 1;
    vviad[1].binding = 0;
    vviad[1].format = VK_FORMAT_VEC3;       // nx, ny, nz
    vviad[1].offset = offsetof( struct vertex, normal );       // 12

    vviad[2].location = 2;
    vviad[2].binding = 0;
    vviad[2].format = VK_FORMAT_VEC3;       // r, g, b
    vviad[2].offset = offsetof( struct vertex, color );       // 24

    vviad[3].location = 3;
    vviad[3].binding = 0;
    vviad[3].format = VK_FORMAT_VEC2;       // s, t
    vviad[3].offset = offsetof( struct vertex, texCoord );   // 36
How We Constructed the Graphics Pipeline Structure Before

```
VkPipelineVertexInputStateCreateInfo  vpvisci;
    // used to describe the input vertex attributes
    vpvisci.sType = VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO;
    vpvisci.pNext = nullptr;
    vpvisci.flags = 0;

    vpvisci.vertexBindingDescriptionCount = 1;
    vpvisci.pVertexBindingDescriptions = vvibd;

    vpvisci.vertexAttributeDescriptionCount = 4;
    vpvisci.pVertexAttributeDescriptions = vviad;
```

```
VkGraphicsPipelineCreateInfo  vgpci;
    vgpci.sType = VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO;
    vgpci.pNext = nullptr;
    vgpci.flags = 0;
    . . .
    vgpci.pVertexInputState = &vpvisci;
    . . .

result = vkCreateGraphicsPipelines( LogicalDevice, VK_NULL_HANDLE, 1, IN &vgpci,
                                     PALLOCATOR, OUT pGraphicsPipeline );
```
Let's assign a different color per instance. Create a data buffer with one glm::vec3 (to hold r, g, b) for each Instance.

```cpp
VkVertexInputBindingDescription vvibd[2];
vvibd[0].binding = 0;           // which binding # this is
vvibd[0].stride = sizeof( struct vertex );              // bytes between successive
vvibd[0].inputRate = VK_VERTEX_INPUT_RATE_VERTEX;

vvibd[1].binding = 1;           // which binding # this is
vvibd[1].stride = sizeof( glm::vec3 );             // bytes between successive entries
vvibd[1].inputRate = VK_VERTEX_INPUT_RATE_INSTANCE;
```

This definition says that we should advance through the input buffer by this much every time we hit a new `instance`.
How We Construct the Graphics Pipeline Structure Now

Let’s assign a different color per Instance.
Create a data buffer with one glm::vec3 (to hold r, g, b) for each Instance.

VkVertexInputAttributeDescription vviad[5];
    // an array containing one of these per vertex attribute in all bindings
    // 4 = vertex, normal, color, texture coord
vviad[0].location = 0;                  // location in the layout decoration
vviad[0].binding = 0;                   // which binding description this is part of
vviad[0].format = VK_FORMAT_VEC3;       // x, y, z
vviad[0].offset = offsetof( struct vertex, position );                  // 0

...  

vviad[5].location = 0;                  // location in the layout decoration
vviad[5].binding = 1;                   // which binding description this is part of
vviad[5].format = VK_FORMAT_VEC3;       // r, g, b
vviad[5].offset = 0;                    // just one element, so offset is 0
How We Construct the Graphics Pipeline Structure Now

Let’s assign a different color per Instance.
Create a data buffer with one glm::vec3 (to hold r, g, b) for each Instance.

```cpp
VkPipelineVertexInputStateCreateInfo vpvisci;
    vpvisci.sType = VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO;
    vpvisci.pNext = nullptr;
    vpvisci.flags = 0;

    vpvisci.vertexBindingDescriptionCount = 2;
    vpvisci.pVertexBindingDescriptions = vvibd;

    vpvisci.vertexAttributeDescriptionCount = 5;
    vpvisci.pVertexAttributeDescriptions = vviad;

    . . .

VkGraphicsPipelineCreateInfo vgpci;
    vgpci.sType = VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO;
    vgpci.pNext = nullptr;
    vgpci.flags = 0;

    . . .
    vgpci.pVertexInputState = &vpvisci;

    . . .

result = vkCreateGraphicsPipelines( LogicalDevice, VK_NULL_HANDLE, 1, IN &vgpci,
                                       PALLOCATOR, OUT pGraphicsPipeline );
```

Note: same names as before, but different sizes
