The Framebuffers

- Depth-Buffer
- Double-buffered Color Framebuffers
- Video Driver

Update → Front → Back → Refresh
The Framebuffer Uses RGB Colors

<table>
<thead>
<tr>
<th>Color</th>
<th># Bits/color</th>
<th># Intensities per color</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>2^8 = 256</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>2^10 = 1024</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>2^12 = 4096</td>
<td></td>
</tr>
</tbody>
</table>

# Bits/pixel | Total colors:
---|---------|
24 | 2^24 = 16.7 M
30 | 2^30 = 1 B
36 | 2^36 = 69 B
Why so many bits?

Many modern algorithms do arithmetic on the framebuffer color components, or treat the framebuffer color components as data. They need the extra precision during the arithmetic. However, the display system cannot display all of those possible colors.

The Framebuffer

- **Alpha** values
  - Transparency per pixel
    - $\alpha = 0.$ is invisible
    - $\alpha = 1.$ is opaque
  - Represented in 8-32 bits (integer or floating point)
  - Alpha blending equation:

$$\text{Color} = \alpha C_1 + (1 - \alpha) C_2$$

$0.0 \leq \alpha \leq 1.0$

Note: this is really blending, not transparency!
The Framebuffer

- **Z-buffer**
  - Used for hidden surface removal
  - Holds pixel depth
  - Typically 32 bits deep
  - Integer or floating point

# Bits / Z  Total Z Values:
32  \(2^{32} = 4\) B

---

```
// swap the double-buffered framebuffers:
glutSwapBuffers();

glutInitDisplayMode( GLUT_RGBA | GLUT_DOUBLE | GLUT_DEPTH);
glDrawBuffer( GL_BACK );
```

You draw into here

This is called the **update**

The monitor displays from here

"swap buffers" changes the role of the two framebuffers

This is called the **refresh**

You draw into here

The monitor displays from here
Double-buffered Color Framebuffers

The viewer sees the contents of this framebuffer

The Video Driver

- N refreshes/second (N is between 50 and 100)
- The framebuffer contains the R,G,B that define the color at each pixel
- Because of the double-buffering, Refresh is asynchronous from Update, that is, the monitor gets refreshed at N (60) frames per second, no matter how fast or slowly you update the back buffer.
