The Basic Computer Graphics Pipeline

Model Transform → View Transform → Per-vertex Lighting → Projection Transform → Homogeneous Division → NDC

Viewport Transform → Fragment Processing, Texturing, Per-fragment Lighting → Raster Ops → Rasterization → SC

MC = Model Coordinates
WC = World Coordinates
EC = Eye Coordinates
CC = Clip Coordinates
NDC = Normalized Device Coordinates
SC = Screen Coordinates

Geometry vs. Topology

Geometry: Where things are (e.g., coordinates)

Topography: How things are connected

Original Object

Geometry = changed
Topology = same (1-2-3-4-1)

Geometry = same
Topology = changed (1-2-4-3-1)

3D Coordinate Systems

Right-handed

Left-handed

Since Homer Simpson uses Right-handed Coordinates, then we will too

Right-handed 3D Coordinate System for a CNC Machine

Right-handed 3D Coordinate System for a CNC Machine
Right-handed Positive Rotations

Y
Z

Right-Handed Coordinate System

Coordinate Spaces

MC = Model Coordinates
WC = World Coordinates
EC = Eye Coordinates
CC = Clip Coordinates
NDC = Normalized Device Coordinates
SC = Screen Coordinates

Drawing in 3D

Set any display-characteristics state that you want to have in effect when you do the drawing.
Begin the drawing. Use the current state’s display-characteristics.

OpenGL Topologies

GL_POINTS
GL_LINES
GL_LINE_LOOP
GL_TRIANGLES
GL_LINES
GL_TRIANGLE_STRIP
GL_TRIANGLE_STRIP
GL_TRIANGLE_FAN
GL_QUADS
GL_POLYGON

OpenGL Topologies – Polygon Requirements

Polygons must be:
- Convex and
- Planar

For that reason, GL_TRIANGLE_STRIP is often preferable to GL_QUAD_STRIP. GL_POLYGON is rarely used.

This is a wonderfully understandable way to start with 3D graphics, but it is also incredibly inefficient! We’ll talk about that later...
Polygons are traditionally:

- CCW when viewed from outside the solid object

It doesn’t actually matter, but there is an advantage in being **consistent**.

---

The disease is referred to as “The Bowtie” 🍁.

---

What does “Convex Polygon” Mean?

We can go all mathematical here, but let’s go visual instead. In a convex polygon, a line between any two points inside the polygon never leaves the inside of the polygon.

---

Why is there a Requirement for Polygons to be Convex?

Graphics polygon-filling hardware can be highly optimized if you know that, no matter what direction you fill the polygon in, there will be two and only two intersections between the scanline and the polygon’s edges.

---

What if you need to display Polygons that are not Convex?

There are two good solutions I know of (and there are probably more):

1. OpenGL’s utility (gluXxx) library has a built-in tessellation capability to break a non-convex polygon into convex polygons.

2. There is an open source library to break a non-convex polygon into convex polygons. It is called *Polypartition*, and is found here:
   
   https://github.com/ivanfratric/polypartition

If you ever need to do this, contact me. I have working code for each approach…

---

Why is there a Requirement for Polygons to be Planar?

Graphics hardware assumes that a polygon has a definite front and a definite back, and that you can only see one of them at a time.
OpenGL Drawing Can Be Done Procedurally

Listing a lot of vertices explicitly gets old in a hurry.

The graphics card can't tell how the numbers in the glVertex3f calls were produced: both explicitly listed and procedurally computed look the same to glVertex3f.

Color

This is referred to as "Additive Color"

Why do the Compound Transformations Take Effect in Reverse Order?

Envision fully-parenthesizing what is going on. In that case, it makes perfect sense that the most recently-set transformation would take effect first.
The OpenGL Drawing State

The designers of OpenGL could have put lots and lots of arguments on the glVertex3f call to totally define the appearance of your drawing, like this:

```c
glVertex3f(x, y, z, r, g, b, m00, ..., m33, s, t, nx, ny, nz, linewidth, ...);
```

Yuch! That would have been ugly. Instead, they decided to let you create a “current drawing state”. You set all of these characteristics first, then they take effect when you do the drawing. They continue to remain in effect for future drawing calls, until you change them.

Set the state first

Use the state second

Projecting an Object from 3D into 2D

- Orthographic (or Parallel) projection
  ```c
  glOrtho(xi, xri, yb, yt, zn, zf);
  ```

- Perspective projection
  ```c
  gluPerspective(fovy, aspect, zn, zf);
  ```

OpenGL Projection Functions

- `glMatrixMode(GL_PROJECTION)`;
- `glLoadIdentity()`;
- `glOrtho(xi, xri, yb, yt, zn, zf);`;
- `gluPerspective(fovy, aspect, zn, zf);`
- `glMatrixMode(GL_MODELVIEW)`;
- `glLoadIdentity()`;
- `gluLookAt(ex, ey, ez, lx, ly, lz, ux, uy, uz);`
- `glTranslatef(tx, ty, tz);`
- `glRotatef(degrees, ax, ay, az);`
- `glScalef(sx, sy, sz);`
- `glColor3f(r, g, b);`
- `glBegin(GL_LINE_STRIP);`
  ```c
  glVertex3f(x0, y0, z0);
  glVertex3f(x1, y1, z1);
  glVertex3f(x2, y2, z2);
  glVertex3f(x3, y3, z3);
  glVertex3f(x4, y4, z4);
  ```
- `glEnd();`

Order Matters!

Compound Transformations are Not Commutative

- Rotate, then translate
- Translate, then rotate

How the Viewing Volumes Look from the Outside

- Parallel/Orthographic
- Perspective

Projecting on Object from 3D to 2D

- Parallel/Orthographic is good for lining things up and comparing sizes
- Perspective is more realistic-looking
The Perspective Viewing Frustum

\[ \text{gluPerspective( fovy, aspect, zn, zf );} \]

- **fovy** = vertical field of view angle (degrees)
- **good values are 50-100°**

Arbitrary Viewing

\[ \text{glMatrixMode( GL_MODELVIEW );} \]
\[ \text{glLoadIdentity( );} \]
\[ \text{gluLookAt( ex, ey, ez, lx, ly, lz, ux, uy, uz );} \]
\[ \text{glTranslatef( tx, ty, tz );} \]
\[ \text{glRotatef( degrees, ax, ay, az );} \]
\[ \text{glScalef( sx, sy, sz );} \]
\[ \text{glColor3f( r, g, b );} \]
\[ \text{glBegin( GL_LINE_STRIP );} \]
\[ \text{glVertex3f( x0, y0, z0 );} \]
\[ \text{glVertex3f( x1, y1, z1 );} \]
\[ \text{glVertex3f( x2, y2, z2 );} \]
\[ \text{glVertex3f( x3, y3, z3 );} \]
\[ \text{glVertex3f( x4, y4, z4 );} \]
\[ \text{glEnd( );} \]

How Can You Be Sure You See Your Scene?

\[ \text{gluPerspective( fovy, aspect, zn, zf );} \]
\[ \text{gluLookAt( ex, ey, ez, lx, ly, lz, ux, uy, uz );} \]

Here’s a good way to start:
1. Set \( lx, ly, lz \) to be the average of all the vertices
2. Set \( ux, uy, uz \) to be 0, 1, 0
3. Set \( ex = lx \) and \( ey = ly \)
4. Now, you back \( ez \) up enough so that the object fits in the viewing volume:

\[ \Delta E = \frac{H}{2 \tan \left( \frac{\pi \cdot \text{fovy}}{2} \right)} \]

Specifying a Viewport

\[ \text{glViewport( ixl, iyb, idx, idy );} \]
\[ \text{glMatrixMode( GL_PROJECTION );} \]
\[ \text{glLoadIdentity( );} \]
\[ \text{gluPerspective( fovy, aspect, zn, zf );} \]
\[ \text{glMatrixMode( GL_MODELVIEW );} \]
\[ \text{glLoadIdentity( );} \]
\[ \text{gluLookAt( ex, ey, ez, lx, ly, lz, ux, uy, uz );} \]
\[ \text{glTranslatef( tx, ty, tz );} \]
\[ \text{glPushMatrix( );} \]
\[ \text{glRotatef( degrees, ax, ay, az );} \]
\[ \text{glScalef( sx, sy, sz );} \]
\[ \text{glColor3f( r, g, b );} \]
\[ \text{glBegin( GL_LINE_STRIP );} \]
\[ \text{glVertex3f( x0, y0, z0 );} \]
\[ \text{glVertex3f( x1, y1, z1 );} \]
\[ \text{glVertex3f( x2, y2, z2 );} \]
\[ \text{glVertex3f( x3, y3, z3 );} \]
\[ \text{glVertex3f( x4, y4, z4 );} \]
\[ \text{glEnd( );} \]
\[ \text{glPopMatrix( );} \]

Saving and Restoring the Current Transformation

\[ \text{glViewport( ixl, iyb, idx, idy );} \]
\[ \text{glMatrixMode( GL_PROJECTION );} \]
\[ \text{glLoadIdentity( );} \]
\[ \text{gluPerspective( fovy, aspect, zn, zf );} \]
\[ \text{glMatrixMode( GL_MODELVIEW );} \]
\[ \text{glLoadIdentity( );} \]
\[ \text{gluLookAt( ex, ey, ez, lx, ly, lz, ux, uy, uz );} \]
\[ \text{glTranslatef( tx, ty, tz );} \]
\[ \text{glPushMatrix( );} \]
\[ \text{glRotatef( degrees, ax, ay, az );} \]
\[ \text{glScalef( sx, sy, sz );} \]
\[ \text{glColor3f( r, g, b );} \]
\[ \text{glBegin( GL_LINE_STRIP );} \]
\[ \text{glVertex3f( x0, y0, z0 );} \]
\[ \text{glVertex3f( x1, y1, z1 );} \]
\[ \text{glVertex3f( x2, y2, z2 );} \]
\[ \text{glVertex3f( x3, y3, z3 );} \]
\[ \text{glVertex3f( x4, y4, z4 );} \]
\[ \text{glEnd( );} \]
\[ \text{glPopMatrix( );} \]
\[ \ldots \]
#includes

void    Resize( int, int );
void    Visibility( int );
void    Axes( float );
void    HsvRgb( float[3], float[3] );
```
Main Program

```c
int main(int argc, char *argv[]) {
    // turn on the glut package:
    // (do this before checking argc and argv since it might
    // pull some command-line arguments out):
    glutInit(&argc, argv);
    // setup all the graphics stuff:
    InitGraphics();
    // make sure you never reinitialize:
    reset();
    // setup all the user interface stuff:
    InitMenus();
    // draw the scene once and wait for some interaction:
    // (this will never return)
    glutSetWindow(MainWindow);
    glutMainLoop();
    // this is here to make the compiler happy:
    return 0;
}
```

InitGraphics(), I

```c
void InitGraphics() {
    // request the display modes:
    // ask for red-green-blue-alpha color, double-buffering, and z-buffering:
    glutDisplayMode(GLUT_RGBA | GLUT_DOUBLE | GLUT_DEPTH);
    // set the initial window configuration:
    glutWindowPosition(0, 0);
    glutWindowSize(INIT_WINDOW_SIZE, INIT_WINDOW_SIZE);
    // open the window and set its title:
    MainWindow = glutCreateWindow(WINDOWTITLE);
    glutSetWindowTitle(WINDOWTITLE);
    // set the framebuffer clear values:
    glClearColor(BACKCOLOR[0], BACKCOLOR[1], BACKCOLOR[2], BACKCOLOR[3]);
    glutSetWindow(MainWindow);
    glutDisplayFunc(Display);
    glutReshapeFunc(Resize);
    glutKeyboardFunc(Keyboard);
    glutMouseFunc(MouseMotion);
    glutMotionFunc(MouseMotion);
    glutTimerFunc(-1, NULL, 0);
    glutIdleFunc(NULL);
}
```

InitGraphics(), II

```c
#ifdef WIN32
    GLenum err = glewInit();
    if (err != GLEW_OK)
        fprintf(stderr, "glewInit Error
" );
#endif
```

Display(), I

```c
void Display() {
    // set which window we want to do the graphics into:
    glutSetWindow(MainWindow);
    // erase the background:
    glDrawBuffer(GL_BACK);
    glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT);
    glEnable(GL_DEPTH_TEST);
    // specify shading to be flat:
    glShadeModel(GL_FLAT);
    // set the viewport to a square centered in the window:
    GLsizei vx = glutGet(GLUT_WINDOW_WIDTH);
    GLsizei vy = glutGet(GLUT_WINDOW_HEIGHT);
    GLsizei v = vx < vy ? vx : vy;                  // minimum dimension
    GLint xl = (vx - v) / 2;
    GLint yb = (vy - v) / 2;
    glViewport(xl, yb, v, v);
    // set the viewing volume:
    // remember that the Z clipping  values are actually
    // given as DISTANCES IN FRONT OF THE EYE
    glMatrixMode(GL_PROJECTION);
    glLoadIdentity();
    if (WhichProjection == ORTHO)
        gluOrtho2D(-3., 3.,    -3., 3.,   0.1, 1000.);
    else
        gluPerspective(90., 1.,        0.1, 1000.);
    // place the objects into the scene:
    glMatrixMode(GL_MODELVIEW);
    glLoadIdentity();
    // set the eye position, look-at position, and up-vector:
    gluLookAt(0., 0., 3.,    0., 0., 0.,     0., 1., 0.);
    // rotate the scene:
    glRotatef((GLfloat)Yrot, 0., 1., 0.);
    glRotatef((GLfloat)Xrot, 1., 0., 0.);
    // uniformly scale the scene:
    if (Scale < MINSCALE)
        Scale = MINSCALE;
    glScalef((GLfloat)Scale, (GLfloat)Scale, (GLfloat)Scale);
    // set the fog parameters:
    if (DepthCueOn != 0)
        { glFogi(GL_FOG_MODE, FOGMODE);

HsvRgb( hsv, rgb );
gColor3fv( rgb );

The OSU ColorPicker Program
Sidebar: How Did We Make the Transition from Vertices to Pixels?

There is a piece of hardware called the Rasterizer. Its job is to interpolate a line or polygon, defined by vertices, into a collection of fragments. Think of it as filling in squares on graph paper.

A fragment is a “pixel-to-be”. In computer graphics, “pixel” is defined as having its full RGBA already computed. A fragment does not yet but all of the information needed to compute the RGBA is there.

A fragment is turned into a pixel by the fragment processing operation.

In CS 457/557, you will do some pretty snazzy things with your own fragment processing code!

Sidebar: Modern Rasterizers can also Anti-Alias Lines and Polygons

No AA  4x  16x
