Why Do We Care About Lighting?

Lighting “dis-ambiguates” 3D scenes

Without lighting

With lighting
The Surface Normal

A surface normal is a vector perpendicular to the surface.

Sometimes surface normals are defined or computed \textit{per-face}.

$$n = ( P1 - P0 ) \times ( P2 - P0 )$$

Sometimes they are defined \textit{per-vertex} to best approximate the underlying surface that the face is representing.
Setting a Surface Normal in OpenGL

```c
glMatrixMode( GL_MODELVIEW );

glTranslatef( tx, ty, tz );
glRotatef( degrees, ax, ay, az );
glScalef( sx, sy, sz );

// Per-face

glNormal3f( nx, ny, nz );

// Per-vertex

glColor3f( r, g, b );
glBegin( GL_TRIANGLES );
    glVertex3f( x0, y0, z0 );
    glVertex3f( x1, y1, z1 );
    glVertex3f( x2, y2, z2 );
glEnd( );
```
Setting a Surface Normal in OpenGL

glMatrixMode( GL_MODELVIEW );
glTranslatef( tx, ty, tz );
glRotatef( degrees, ax, ay, az );
glScalef( sx, sy, sz );
glColor3f( r, g, b );
glBegin(GL_TRIANGLES );
  glNormal3f( nx0, ny0, nz0 );
glVertex3f( x0, y0, z0 );
  glNormal3f( nx1, ny1, nz1 );
glVertex3f( x1, y1, z1 );
  glNormal3f( nx2, ny2, nz2 );
glVertex3f( x2, y2, z2 );
glEnd( );
Flat Shading (Per-face)

```c
glMatrixMode( GL_MODELVIEW );

glTranslatef( tx, ty, tz );
glRotatef( degrees, ax, ay, az );
glScalef( sx, sy, sz );

glShadeModel( GL_FLAT );
glNormal3f( nx, ny, nz );

glColor3f( r, g, b );
glBegin(GL_TRIANGLES );
    glVertex3f( x0, y0, z0 );
    glVertex3f( x1, y1, z1 );
    glVertex3f( x2, y2, z2 );
glEnd( );
```
Smooth Shading (Per-vertex)

```c
glMatrixMode( GL_MODELVIEW );

glTranslatef( tx, ty, tz );
glRotatef( degrees, ax, ay, az );
glScalef( sx, sy, sz );

glShadeModel( GL_SMOOTH );

glColor3f( r, g, b );
glBegin(GL_TRIANGLES );
  glNormal3f( nx0, ny0, nz0 );
  glVertex3f( x0, y0, z0 );
  glNormal3f( nx1, ny1, nz1 );
  glVertex3f( x1, y1, z1 );
  glNormal3f( nx2, ny2, nz2 );
  glVertex3f( x2, y2, z2 );

glEnd( );
```
OpenGL Surface Normals Need to be Unitized by Someone

```c
glTranslatef( tx, ty, tz );
glRotatef( degrees,  ax, ay, az );
glScalef( sx, sy, sz );

glNormal3f( nx, ny, nz );
```

OpenGL expects the normal vector to be a unit vector, that is:

$$nx^2 + ny^2 + nz^2 = 1$$

If it is not, or if you are using scaling transformations, you can force OpenGL to do the unitizing for you with:

```c
glEnable( GL_NORMALIZE );
```
The OpenGL “built-in” Lighting Model

- \( P \) Point being illuminated
- \( I \) Light intensity
- \( L \) Unit vector from point to light
- \( n \) Unit vector surface normal
- \( R \) Perfect reflection unit vector
- \( E \) Unit vector to eye position
The OpenGL “built-in” Lighting Model

1. **Ambient** = a constant
   - Accounts for light bouncing “everywhere”

2. **Diffuse** = \( I \cdot \cos \Theta \)
   - Accounts for the angle between the incoming light and the surface normal

3. **Specular** = \( I \cdot \cos^S \phi \)
   - Accounts for the angle between the “perfect reflector” and the eye. The exponent, \( S \), accounts for surface shininess

Note that \( \cos \Theta \) is just the dot product between unit vectors \( L \) and \( n \)

Note that \( \cos \phi \) is just the dot product between unit vectors \( R \) and \( E \)
Diffuse Lighting works because of spreading out the same amount of light energy across more surface area.

\[ \text{Diffuse} = I \cdot \cos \Theta \]
The Specular Lighting equation is a heuristic that approximates reflection from a rough surface.

\[ \text{Specular} = I \cos^S \phi \]

\( S \approx \text{“shininess”} \)

\( 1/S \approx \text{“roughness”} \)
The Three Elements of Computer Graphics Lighting

- Ambient
- Diffuse
- Specular

= Complete lighting effect
Types of Light Sources

- Point
- Directional (Parallel, Sun)
- Spotlight
Lighting Examples

Point Light at the Eye

Point Light at the Origin
Lighting Examples

Spot Lights
Colored Lights Shining on Colored Objects

What the light can produce

ER = LR * MR
EG = LG * MG
EB = LB * MB

What the material can reflect

ER = LR * MR
EG = LG * MG
EB = LB * MB

White Light

Green Light
Too Many Lighting Options

If there is one light and one material, the following things can be set independently:

- Global scene ambient red, green, blue
- Light position: x, y, z
- Light ambient red, green, blue
- Light diffuse red, green, blue
- Light specular red, green, blue
- Material reaction to ambient red, green, blue
- Material reaction to diffuse red, green, blue
- Material reaction to specular red, green, blue
- Material specular shininess

This makes for 25 things that can be set for just one light and one material! While many combinations are possible, some make more sense than others.
Ways to Simplify Too Many Lighting Options

1. Set the ambient light globally using, for example,
   \[
   \text{glLightModelfv( GL\_LIGHT\_MODEL\_ambiENT, MulArray3( .3f, White ) )}
   \]
   i.e., set it to some low intensity of white.

2. Set the light’s ambient component to zero.

3. Set the light’s diffuse and specular components to the full color of the light.

4. Set each material’s ambient and diffuse to the full color of the object.

5. Set each material’s specular component to some fraction of white.
float White[ ] = { 1.,1.,1.,1. };

// utility to create an array from 3 separate values:

float *
Array3( float a, float b, float c )
{
    static float array[4];
    array[0] = a;
    array[1] = b;
    array[2] = c;
    array[3] = 1.;
    return array;
}

// utility to create an array from a multiplier and an array:

float *
MulArray3( float factor, float array0[3] )
{
    static float array[4];
    array[0] = factor * array0[0];
    array[1] = factor * array0[1];
    array[2] = factor * array0[2];
    array[3] = 1.;
    return array;
}
Setting the Material Characteristics

```c
glMaterialfv( GL_BACK, GL_AMBIENT, MulArray3( .4, White ) );
glMaterialfv( GL_BACK, GL_DIFFUSE, MulArray3( 1., White ) );
glMaterialfv( GL_BACK, GL_SPECULAR, Array3( 0., 0., 0. ) );
glMaterialf ( GL_BACK, GL_SHININESS, 5. );
glMaterialfv( GL_BACK, GL_EMISSION, Array3( 0., 0., 0. ) );

glMaterialfv( GL_FRONT, GL_AMBIENT, MulArray3( 1., rgb ) );
glMaterialfv( GL_FRONT, GL_DIFFUSE, MulArray3( 1., rgb ) );
glMaterialfv( GL_FRONT, GL_SPECULAR, MulArray3( .7, White ) );
glMaterialf ( GL_FRONT, GL_SHININESS, 8. );
glMaterialfv( GL_FRONT, GL_EMISSION, Array3( 0., 0., 0. ) );
```
You can have multiple lights

\textbf{Attenuation} = \frac{1}{C + Ld + Qd^2} \quad \text{where } d \text{ is the distance from the light to the point being lit}
Setting the Light Position

```
glMatrixMode( GL_MODELVIEW );
glLoadIdentity( );

// if we do this, then the light will be wrt the scene at XLIGHT, YLIGHT, ZLIGHT:

glLightfv( GL_LIGHT0, GL_POSITION, Array3(XLIGHT, YLIGHT, ZLIGHT) );

// translate the object into the viewing volume:

gluLookAt( XEYE, YEYE, ZEYE, 0., 0., 0., 0., 1., 0. );

// if we do this, then the light will be wrt the eye at XLIGHT, YLIGHT, ZLIGHT:

// glLightfv( GL_LIGHT0, GL_POSITION, Array3(XLIGHT, YLIGHT, ZLIGHT) );
```

The light position gets transformed by the value of the **ModelView matrix** at the moment the light position is set.
// perform the rotations and scaling about the origin:

glRotatef( Xrot, 1., 0., 0. );
glRotatef( Yrot, 0., 1., 0. );
glScalef( Scale, Scale, Scale );

// if we do this, then the light will be wrt to the object at XLIGHT, YLIGHT, ZLIGHT:

// glLightfv( GL_LIGHT0, GL_POSITION, Array3(XLIGHT, YLIGHT, ZLIGHT) );

// specify the shading model:

glShadeModel( GL_SMOOTH );

// enable lighting:

glEnable( GL_LIGHTING );

glEnable( GL_LIGHT0 );

// draw the objects:

. . .

You can enable and disable lighting “at all”. (This toggles between using the lighting equations
say and what glColor3f( ) says
You can enable and disable each light independently

It is usually good form to disable the lighting after you
are done using it
Sidebar: Why are Light Positions 4-element arrays where the 4th element is 1.0? Homogeneous Coordinates!

float *
Array3( float a, float b, float c )
{
    static float array[4];
    array[0] = a;
    array[1] = b;
    array[2] = c;
    array[3] = 1.0;
    return array;
}

We usually think of a 3D point as being represented by a triple: (x,y,z).

Using homogeneous coordinates, we add a 4th number: (x,y,z,w)

Graphics systems take (x,y,z,w) and then divide x, y, and z by w before using them.

\[
X = \frac{x}{w}, \quad Y = \frac{y}{w}, \quad Z = \frac{z}{w}
\]

Thus (1,2,3,1), (2,4,6,2), (-1,-2,-3,-1) all represent the same 3D point.
This Lets us Represent Points at Infinity

This is useful to be able specify a parallel light source by placing the light source location at infinity.

The point (1,2,3,1) represents the 3D point (1,2,3)
The point (1,2,3,.5) represents the 3D point (2,4,6)
The point (1,2,3,.01) represents the point (100,200,300)

So, (1,2,3,0) represents a point at infinity, but along the ray from the origin through (1,2,3).

Points-at-infinity are used for parallel light sources and some shadow algorithms
Additional Parameters for Spotlights

\texttt{glLightfv( GL\_LIGHT0, GL\_SPOT\_DIRECTION, \text{Array3(xdir,ydir,zdir)} )}

Specifies the spotlight-pointing direction. This gets transformed by the current value of the ModelView matrix.

\texttt{glLightf( GL\_LIGHT0, GL\_SPOT\_EXPONENT, e )}

Specifies the spotlight directional intensity. This acts very much like the exponent in the specular lighting equation.

\texttt{glLightf( GL\_LIGHT0, GL\_SPOT\_CUTOFF, deg )}

Specifies the spotlight maximum spread angle.
void 
SetMaterial( float r, float g, float b, float shininess )
{
  glMaterialfv( GL_BACK, GL_EMISSION, Array3( 0., 0., 0. ) );
glMaterialfv( GL_BACK, GL_AMBIENT, MulArray3( .4f, White ) );
glMaterialfv( GL_BACK, GL_DIFFUSE, MulArray3( 1., White ) );
glMaterialfv( GL_BACK, GL_SPECULAR, Array3( 0., 0., 0. ) );
glMaterialf ( GL_BACK, GL_SHININESS, 2.f );

  glMaterialfv( GL_FRONT, GL_EMISSION, Array3( 0., 0., 0. ) );
glMaterialfv( GL_FRONT, GL_AMBIENT, Array3( r, g, b ) );
glMaterialfv( GL_FRONT, GL_DIFFUSE, Array3( r, g, b ) );
glMaterialfv( GL_FRONT, GL_SPECULAR, MulArray3( .8f, White ) );
glMaterialf ( GL_FRONT, GL_SHININESS, shininess );
}

Definition of GL_FRONT and GL_BACK:

GL_FRONT side Vertices are CCW when viewed from the outside

GL_BACK side Vertices are CW when viewed from the outside
void **SetPointLight**( int ilight, float x, float y, float z, float r, float g, float b )
{
    glLightfv( ilight, GL_POSITION,  Array3( x, y, z ) );
glLightfv( ilight, GL_AMBIENT,   Array3( 0., 0., 0. ) );
glLightfv( ilight, GL_DIFFUSE,   Array3( r, g, b ) );
glLightfv( ilight, GL_SPECULAR, Array3( r, g, b ) );
glLightf( ilight, GL_CONSTANT_ATTENUATION, 1. );
glLightf( ilight, GL_LINEAR_ATTENUATION, 0. );
glLightf( ilight, GL_QUADRATIC_ATTENUATION, 0. );
gEnable( ilight );
}

void **SetSpotLight**( int ilight, float x, float y, float z, float xdir, float ydir, float zdir, float r, float g, float b )
{
    glLightfv( ilight, GL_POSITION,  Array3( x, y, z ) );
glLightfv( ilight, GL_AMBIENT,   Array3( 0., 0., 0. ) );
glLightfv( ilight, GL_DIFFUSE,   Array3( r, g, b ) );
glLightfv( ilight, GL_SPECULAR, Array3( r, g, b ) );
glLightf( ilight, GL_CONSTANT_ATTENUATION, 1. );
glLightf( ilight, GL_LINEAR_ATTENUATION, 0. );
glLightf( ilight, GL_QUADRATIC_ATTENUATION, 0. );
gEnable( ilight );
Sidebar: Note that we are computing the light intensity at each vertex first, and then interpolating that intensity across the polygon second.

That is, you are only using the lighting model at each vertex. You can do an even better job if you interpolate the normal across the polygon first, and then compute the light intensity with the lighting model at each fragment second.
But, for that you will need the Shaders course (CS 457/557)
Sidebar: Smooth Shading can also interpolate vertex colors, not just the results of the lighting model.

```c
glMatrixMode( GL_MODELVIEW );

glTranslatef( tx, ty, tz );
glRotatef( degrees, ax, ay, az );
glScalef( sx, sy, sz );

glShadeMode( GL_SMOOTH );

glBegin(GL_TRIANGLES );
    glColor3f( r0, g0, b0 );
    glVertex3f( x0, y0, z0 );
    glColor3f( r1, g1, b1 );
    glVertex3f( x1, y1, z1 );
    glColor3f( r2, g2, b2 );
    glVertex3f( x2, y2, z2 );

glEnd( );
```
Smooth Shading can also interpolate vertex colors, not just the results of the lighting model

This is especially useful when using colors for scientific visualization:
