Dome Projection using a Vertex Shader

Programming a Dome display is easier when only a single projector is used.

A fisheye lens distorts the image so that it spreads out across the dome. The trick is pre-distorting the image in the other direction so that it looks correct after being projected.

Dome Projection:
Viewing Volume = (-1,-1) to (1,1)
The edge of the circle represents the edge of the dome projection = your left, right, bottom, top as you are sitting in the theater.

Dome Vertex Shader:
const float PI = 3.14159265;

void main() {
    vec4 pos = gl_ModelViewMatrix * gl_Vertex;
    float lenxy = length(pos.xy);
    float phi = atan(lenxy, -pos.z);
    pos.xy = (phi / (PI/2.)) * (pos.xy / lenxy);
    gl_Position = gl_ProjectionMatrix * pos;
}

Dome Distortion
Move the teapot so it surrounds the audience.
Flow Visualization in the Dome

Mars Panoram in the Dome

Large Lines and Polygons Need to be Tessellated

- Bounding Box edges were not tessellated.
- Curved lines on the monitor produced straight lines on the dome.

- Bounding Box edges were tessellated.
- Straight lines on the monitor produced curved lines on the dome.

Note: This edge does not pass through the flow vectors!
