## Zooming and Panning Around a Complex 2D Display

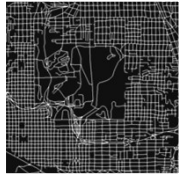

- Standard (Euclidean) geometry zooming forces much of the information off the screen
- This eliminates the context from the zoomed-in display
- This problem can be solved with *hyperbolic methods* if we are willing to give up Euclidean geometry
- At one time, this would have also meant severely giving up graphics performance, but not now (thanks to shaders)

## Polar Hyperbolic Equations

Overall theme: something divided by something a little bigger

$\lim_{K \rightarrow 0} R' = 1$

$\lim_{K \rightarrow \infty} R' = 0$

$(X, Y)$

$R$

$R' = R / (R + K)$

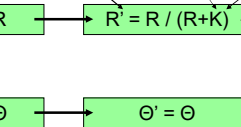

$\Theta$

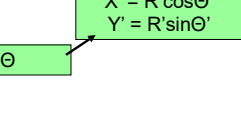

$\Theta' = \Theta$

$X' = R' \cos \Theta'$   
 $Y' = R' \sin \Theta'$

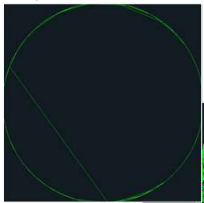

Oregon State University  
Computer Graphics

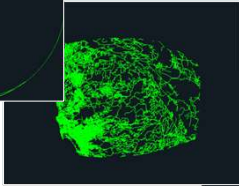

6

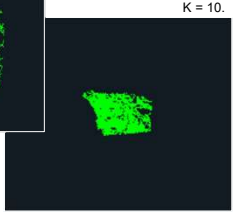

## The Effect of K

$K = 0.$ 

$\lim_{K \rightarrow 0} R' = 1$

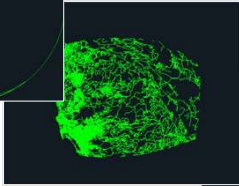

$\lim_{K \rightarrow \infty} R' = 0$

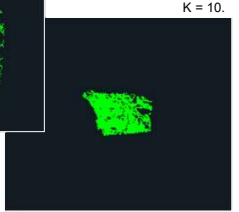

$K = 1.$ 

$K = 10.$

Computer Graphics

### Polar Hyperbolic Equations

$R = \sqrt{X^2 + Y^2}$   
 $\Theta = \tan^{-1}\left(\frac{Y}{X}\right)$

But fortunately, we don't actually need to ever call the atan() function because there are shortcuts to get what we need:

$\cos \Theta = \frac{X}{R}$   
 $\sin \Theta = \frac{Y}{R}$

$R' = \frac{R}{R+K}$

Coordinates moved to the outer edge when  $K = 0$   
 Coordinates moved to the center when  $K = \infty$

$X' = R' \cos \Theta = \frac{R}{R+K} \times \frac{X}{R} = \frac{X}{R+K}$   
 $Y' = R' \sin \Theta = \frac{R}{R+K} \times \frac{Y}{R} = \frac{Y}{R+K}$

Computer Graphics

### Cartesian Hyperbolic Equations

**Polar**

$X' = \frac{X}{R+K}$   
 $Y' = \frac{Y}{R+K}$

Coordinates moved to the outer edge when  $K = 0$   
 Coordinates moved to the center when  $K = \infty$

**Cartesian**

$X' = \frac{X}{\sqrt{X^2 + K^2}}$   
 $Y' = \frac{Y}{\sqrt{Y^2 + K^2}}$

Coordinates moved to the outer edge when  $K = 0$   
 Coordinates moved to the center when  $K = \infty$

### hyper.vert

```

#version 330 compatibility
uniform bool    uPolar;
uniform float    uK;
uniform float    uTransX;
uniform float    uTransY;
out vec3         vColor;

void
main()
{
    vColor = gl_Color.rgb;

    vec2 pos = ( gl_ModelViewMatrix * gl_Vertex ).xy;
    pos += vec2( uTransX, uTransY );
    float r = length( pos );

    vec4 pos2 = vec4( 0., 0., -5., 1. );

    if( uPolar )
        pos2.xy = pos / ( r + uK );
    else
        pos2.xy = pos / ( pos*pos + uK*uK );

    gl_Position = gl_ProjectionMatrix * pos2;
}

```
