Tessellation Shaders

This work is licensed under a Creative Commons Attribution-NonCommercial-NoDerivatives 4.0 International License
Why do we need a Tessellation step right in the pipeline?

- You can perform adaptive subdivision based on a variety of criteria (size, curvature, etc.)
- You can provide coarser models, but have finer ones displayed (≈ geometric compression)
- You can apply detailed displacement maps without supplying equally detailed geometry
- You can apply detailed normal maps without supplying equally detailed geometry
- You can adapt visual quality to the required level of detail
- You can create smoother silhouettes
- You can do all of this, and someone else will supply the geometric patterns for you!

What *built-in* patterns can the Tessellation shaders produce?

- Lines
- Triangles
- Quads (subsequently broken into triangles)
The Tessellation Shaders: Where Do they Fit in the Pipeline?

If in use, it is always the first stop after the Vertex Shader.

- Fixed Function
- Programmable

Oregon State University Computer Graphics
Tessellation Shader Organization

Transformed xyz Patch Vertices from the Vertex Shader

Tessellation Control Shader

New Patch Vertices in xyz, How much to tessellate, Per-vertex attributes

Tessellation Primitive Generator

uvw vertices for the tessellated primitives

Tessellation Evaluation Shader

xyz vertices

Primitive Assembly

Patch Vertices and Per-patch Attributes

One call per output vertex. Consumes the entire patch. Determines how much to tessellate.

One call per patch. Tessellates the curve or surface into uvw coordinates.

One call per generated uvw vertex. Evaluate the curve or surface. Possibly apply a displacement map.
The **Tessellation Control Shader (TCS)** transforms the input coordinates to a regular surface representation. It also computes the required tessellation level based on distance to the eye, screen space spanning, hull curvature, or displacement roughness. There is one invocation per output vertex.

The Fixed-Function **Tessellation Primitive Generator (TPG)** generates semi-regular u-v-w coordinates in specific patterns. (In fact, if it had been up to me, this would have been called the **Tessellation Pattern Generator**.)

The **Tessellation Evaluation Shader (TES)** evaluates the surface in $uvw$ coordinates. It interpolates attributes and applies displacements. There is one invocation per generated vertex.

There is a new “Patch” primitive – it is the face and its neighborhood:

```gl
glBegin( GL_PATCHES )
```

followed by some number of `glVertex3f()` calls. There is no implied purpose, number of vertices, or vertex ordering – those are given by you in how you write the shader.
In the OpenGL Program

```
glPatchParameteri( GL_PATCH_VERTICES, num ); // #of vertices in each patch
glBegin( GL_PATCHES );
    glVertex3f( ... );
    glVertex3f( ... );
glEnd( );
```

These have no implied topology – they will be given to you in an array. It’s up to your shader to interpret the order.

```
GLuint tcs = glCreateShader( GL_TESS_CONTROL_SHADER );

GLuint tes = glCreateShader( GL_TESS_EVALUATION_SHADER );
```

If you have a TCS, you must also have a Vertex Shader

Check the OpenGL extension:
"GL_ARB_tessellation_shader"

In GLSL:
```
#version 400
#extension GL_ARB_tessellation_shader : enable
```
TCS Inputs

`gl_in[ ]` is an array of structures:

```c
struct {
    vec4 gl_Position;
    float gl_PointSize;
    float gl_ClipDistance[6];
} gl_in[ ];
```

`gl_InvocationID` tells you which output vertex you are working on. This *must* be the index into the `gl_in[ ]` array.

`gl_PatchVerticesIn` is the number of vertices in each patch and the dimension of `gl_in[ ]`

`gl_PrimitiveID` is the number of primitives since the last `glBegin( )` (the first one is #0)
**TCS Outputs**

\[ \text{gl\_out[ ]} \text{ is an array of structures:} \]

\[
\text{struct} \\
\{ \\
\text{vec4 gl\_Position;} \\
\text{float gl\_PointSize;} \\
\text{float gl\_ClipDistance[ 6 ];} \\
\} \text{ gl\_out[ ];} \\
\]

\text{layout( vertices = n ) out;} \quad \text{Used to specify the number of vertices output to the TPG}

\text{gl\_TessLevelOuter[4]} \text{ is a built-in array containing up to 4 outside edges of tessellation levels}

\text{gl\_TessLevelInner[2]} \text{ is a built-in array containing up to 2 inside edges of tessellation levels}
User-defined variables defined per-vertex are qualified as “out”

User-defined variables defined per-patch are qualified as “patch out”

Defining how many vertices this patch will output:

```glsl
layout( vertices = 16 ) out;
```
TES Inputs

Reads one triplet of 0. <= (u,v,w) <= 1. coordinates in the built-in variable vec3 gl_TessCoord

User-defined variables defined per-vertex are qualified as “out”
User-defined variables defined per-patch are qualified as “patch out”

gl_in[ ] is an array of structures coming from the TCS:

```c
struct
{
    vec4 gl_Position;
    float gl_PointSize;
    float gl_ClipDistance[6];
} gl_in[ ];
```

```
layout(                     ,                                              ,               , point_mode )  in;
```

```c
triangles
quads
isolines
```
```
    equal_spacing
    fractional_even_spacing
    fractional_odd_spacing
```
```
    { ccw
        cw
    }, point_mode ) in;
```
Tessellation Primitive Pattern Generator (TPG)

- The TPG is “fixed-function”, i.e., you can’t change its operation except by setting parameters

- The TPG consumes all vertices from the TCS and emits vertices for the triangles, quads, or isolines patterns

- The TPG outputs a series of vertices as coordinates in barycentric, i.e., in terms of the parameters (u,v,w)

- Really, only (u,v) are unique: for triangles w = 1 – u – v

- Just (u,v) are used for quads and isolines
**TES Output Topologies: the Quad Pattern**

`gl_TessLevelOuter[4]` is an array containing up to 4 outside edges of tessellation levels.

`gl_TessLevelInner[2]` is an array containing up to 2 inside edges of tessellation levels.
**TES Output Topologies: the Isolines Pattern**

*gl_TessLevelOuter*[4] is an array containing up to 4 outside edges of tessellation levels. *gl_TessLevelInner*[2] is an array containing up to 2 inside edges of tessellation levels.

Top line not drawn

![Diagram of TES Output Topologies](image)

OL0 == 1 implies that you just want to draw a single curve
How triangle barycentric coordinates work

\[ u + v + w = 1 \]

\textbf{TES Output Topologies: the Triangle Pattern}

\textbf{gl\_TessLevelOuter[4]} is an array containing up to 4 outside edges of tessellation levels.

\textbf{gl\_TessLevelInner[2]} is an array containing up to 2 inside edges of tessellation levels.
Examples

In these examples:

1. I am using glman to run them. The only necessary input files are the glman .glib file and the shader files. If you aren’t using glman, you can do this from a full OpenGL program.

2. All of the surface examples use the Geometry Shader triangle-shrink shader. This isn’t necessary, but is educational to really see how much and where the surfaces have been tessellated.
Example: A Bézier Curve

\[ P(u) = (1 - u)^3 P_0 + 3u(1 - u)^2 P_1 + 3u^2(1 - u)P_2 + u^3 P_3 \]

Need to pass 4 points in to define the curve. Need to pass N points out to draw the curve as a line strip.
Example: A Bézier Curve

\[ P(u) = (1-u)^3 P_0 + 3u(1-u)^2 P_1 + 3u^2(1-u)P_2 + u^3 P_3 \]

1. You program the Tessellation Control Shader to decide how much to tessellate the curve based on screen area, curvature, etc.

Can even tessellate non-uniformly if you want, such as using more points where the curvature is higher

The OpenGL tessellation can also do 1D curves. Just set OL0 == 1.
Example: A Bézier Curve

2. The Tessellation Primitive Generator generates $u, v, w$ values for as many subdivisions as the TCS asked for.
Example: A Bézier Curve

\[ P(u) = (1-u)^3 P_0 + 3u(1-u)^2 P_1 + 3u^2(1-u)P_2 + u^3P_3 \]

3. The Tessellation Evaluation Shader computes the x,y,z coordinates based on the TPG’s u values

\[ P(u) = u^3 (-P_0 + 3P_1 - 3P_2 + P_3) + u^2 (3P_0 - 6P_1 + 3P_2) + u(-3P_0 + 3P_1) + P_0 \]

where P is actually \( \{x\} \) , \( \{y\} \) , \( \{z\} \)
In an OpenGL Program

```c
glPatchParameteri( GL_PATCH_VERTICES, 4 );

glBegin( GL_PATCHES );
    glVertex3f( x0, y0, z0 );
    glVertex3f( x1, y1, z1 );
    glVertex3f( x2, y2, z2 );
    glVertex3f( x3, y3, z3 );
glEnd( );
```
In a .glib File

```glsl
##OpenGL GLIB
Perspective 70

Vertex    beziercurve.vert
Fragment   beziercurve.frag
TessControl  beziercurve.tcs
TessEvaluation  beziercurve.tes
Program BezierCurve  uOuter0 <0 1 5>  uOuter1 <3 5 50>

Color 1. .5 0. 1.

NumPatchVertices 4
glBegin gl_patches
    glVertex 0. 0. 0.
    glVertex 1. 1. 1.
    glVertex 2. 1. 0.
    glVertex 3. 0. 1.
glend
```
#version 400
#extension GL_ARB_tessellation_shader: enable

uniform int uOuter0, uOuter1;

layout( vertices = 4 ) out;

void
main()
{
    gl_out[ gl_InvocationID ].gl_Position = gl_in[ gl_InvocationID ].gl_Position;

    gl_TessLevelOuter[0] = float( uOuter0 );
    gl_TessLevelOuter[1] = float( uOuter1 );
}
In the TES Shader

```cpp
#version 400
#extension GL_ARB_tessellation_shader: enable

layout( isolines, equal_spacing) in;

void
main( )
{
    vec4 p0 = gl_in[0].gl_Position;
    vec4 p1 = gl_in[1].gl_Position;
    vec4 p2 = gl_in[2].gl_Position;
    vec4 p3 = gl_in[3].gl_Position;

    float u = gl_TessCoord.x;// the basis functions:
    float b0 = (1.-u) * (1.-u) * (1.-u);
    float b1 = 3. * u * (1.-u) * (1.-u);
    float b2 = 3. * u * u * (1.-u);
    float b3 = u * u * u;

    gl_Position = b0*p0 + b1*p1 + b2*p2 + b3*p3;
}
```

Assigning the intermediate pi's is here to make the code more readable. From what I have seen, the compiler will optimize this away.
Example: A Bézier Curve

Outer1 = 5

Outer1 = 50
Example: A Bézier Surface
Bézier Surface Parametric Equations

\[ P(u, v) = \begin{bmatrix} (1-u)^3 & 3u(1-u)^2 & 3u^2(1-u) & u^3 \end{bmatrix} \begin{bmatrix} P_{00} & P_{01} & P_{02} & P_{03} \\ P_{10} & P_{11} & P_{12} & P_{13} \\ P_{20} & P_{21} & P_{22} & P_{23} \\ P_{30} & P_{31} & P_{32} & P_{33} \end{bmatrix} \begin{bmatrix} (1-v)^3 \\ 3v(1-v)^2 \\ 3v^2(1-v) \\ v^3 \end{bmatrix} \]
In an OpenGL Program

```
glPatchParameteri( GL_PATCH_VERTICES, 16 );

glBegin( GL_PATCHES );
    glVertex3f( x00, y00, z00 );
    glVertex3f( x10, y10, z10 );
    glVertex3f( x20, y20, z20 );
    glVertex3f( x30, y30, z30 );
    glVertex3f( x01, y01, z01 );
    glVertex3f( x11, y11, z11 );
    glVertex3f( x21, y21, z21 );
    glVertex3f( x31, y31, z31 );
    glVertex3f( x02, y02, z02 );
    glVertex3f( x12, y12, z12 );
    glVertex3f( x22, y22, z22 );
    glVertex3f( x32, y32, z32 );
    glVertex3f( x03, y03, z03 );
    glVertex3f( x13, y13, z13 );
    glVertex3f( x23, y23, z23 );
    glVertex3f( x33, y33, z33 );
glEnd( );
```

This order is not set by OpenGL. It is set by you. Pick a convention yourself and stick to it!
GLSL doesn’t care as long as you are consistent.

    vec4 p12 = gl_in[9].gl_Position;
    vec4 p22 = gl_in[10].gl_Position;
    vec4 p03 = gl_in[12].gl_Position;
    vec4 p13 = gl_in[13].gl_Position;
    vec4 p23 = gl_in[14].gl_Position;
    vec4 p33 = gl_in[15].gl_Position;

    float u = gl_TessCoord.x;
    float v = gl_TessCoord.y;
}
```

Assigning the intermediate pij’s is here to make the code more readable. From what I’ve seen, the compiler will optimize this away.
In the TES Shader –

// the basis functions:

float bu0 = (1.-u) * (1.-u) * (1.-u);
float bu1 = 3. * u * (1.-u) * (1.-u);
float bu2 = 3. * u * u * (1.-u);
float bu3 = u * u * u;

float dbu0 = -3. * (1.-u) * (1.-u);
float dbu1 =  3. * (1.-u) * (1.-3.*u);
float dbu2 =  3. * u * (2.-3.*u);
float dbu3 =  3. * u * u;

float bv0 = (1.-v) * (1.-v) * (1.-v);
float bv1 = 3. * v * (1.-v) * (1.-v);
float bv2 = 3. * v * v * (1.-v);
float bv3 = v * v * v;

float dbv0 = -3. * (1.-v) * (1.-v);
float dbv1 =  3. * (1.-v) * (1.-3.*v);
float dbv2 =  3. * v * (2.-3.*v);
float dbv3 =  3. * v * v;

// finally, we get to compute something:

gl_Position = bu0 * ( bv0*p00 + bv1*p01 + bv2*p02 + bv3*p03 )
+ bu1 * ( bv0*p10 + bv1*p11 + bv2*p12 + bv3*p13 )
+ bu2 * ( bv0*p20 + bv1*p21 + bv2*p22 + bv3*p23 )
+ bu3 * ( bv0*p30 + bv1*p31 + bv2*p32 + bv3*p33)
In the TES Shader – Computing the Normal, given a u and v

Tangent Vectors

```
vec4 dpdu = 
    dbu0 * ( bv0*p00 + bv1*p01 + bv2*p02 + bv3*p03 ) 
    + dbu1 * ( bv0*p10 + bv1*p11 + bv2*p12 + bv3*p13 ) 
    + dbu2 * ( bv0*p20 + bv1*p21 + bv2*p22 + bv3*p23 ) 
    + dbu3 * ( bv0*p30 + bv1*p31 + bv2*p32 + bv3*p33 );

vec4 dpdv = 
    bu0 * ( dbv0*p00 + dbv1*p01 + dbv2*p02 + dbv3*p03 ) 
    + bu1 * ( dbv0*p10 + dbv1*p11 + dbv2*p12 + dbv3*p13 ) 
    + bu2 * ( dbv0*p20 + dbv1*p21 + dbv2*p22 + dbv3*p23 ) 
    + bu3 * ( dbv0*p30 + dbv1*p31 + dbv2*p32 + dbv3*p33 );

teNormal = normalize( cross( dpdu.xyz, dpdv.xyz ) );
```
Example: A Bézier Surface

\[ u_{\text{Outer02}} = u_{\text{Outer13}} = 10 \]
\[ u_{\text{Inner0}} = u_{\text{Inner1}} = 5 \]

\[ u_{\text{Outer02}} = u_{\text{Outer13}} = 10 \]
\[ u_{\text{Inner0}} = u_{\text{Inner1}} = 10 \]
Smoothing the edge boundaries is one of the reasons that you can set Outer and Inner tessellation levels separately.
Example: Whole-Sphere Subdivision

`spherical.glib`

```plaintext
##OpenGL GLIB

Vertex    spheresubd.vert
Fragment  spheresubd.frag
TessControl  spheresubd.tcs
TessEvaluation  spheresubd.tes
Geometry    spheresubd.geom

Program SphereSubd
  uDetail <1 30 200>
  uScale <0.1 1. 10.>
  uShrink <0. 1. 1.>
  uFlat <false>
  uColor {1. 1. 0. 0.}
  uLightX <-10. 5. 10.> uLightY <-10. 10. 10.> uLightZ <-10. 10. 10.>

Color 1. 1. 0.

NumPatchVertices 1

glBegin gl_patches
  glVertex 0. 0. 0. .2
  glVertex 0. 1. 0. .3
  glVertex 0. 0. 1. .4

glEnd
```

Using the x, y, z, and w to specify the center and radius of the sphere.
#version 400 compatibility

out vec3 vCenter;
out float vRadius;

void main( )
{
    vCenter = gl_Vertex.xyz;
    vRadius = gl_Vertex.w;

    gl_Position = vec4( 0., 0., 0., 1. );
    // doesn’t matter now – we will fill in the coords later
}

Using the x, y, z, and w to specify the center and radius of the sphere
Example: Whole-Sphere Subdivision

`spheresubd.tcs`

```cpp
#version 400 compatibility
#extension GL_ARB_tessellation_shader : enable

in float   vRadius[ ];
in vec3  vCenter[ ];

patch out float   tcRadius;
patch out vec3  tcCenter;

uniform float uDetail;
uniform float uScale;

layout( vertices = 1 )  out;

void main( )
{
    gl_out[ gl_InvocationID ].gl_Position = gl_in[ 0 ].gl_Position;   // (0,0,0,1)

    tcCenter = vCenter[ 0 ];
    tcRadius = vRadius[ 0 ];

    gl_TessLevelOuter[0] = 2.;
    gl_TessLevelOuter[1] = uScale * tcRadius * uDetail;
    gl_TessLevelOuter[2] = 2.;
    gl_TessLevelOuter[3] = uScale * tcRadius * uDetail;
    gl_TessLevelInner[0]  = uScale * tcRadius * uDetail;
    gl_TessLevelInner[1]  = uScale * tcRadius * uDetail;
}
```

Using the scale and the radius to help set the tessellation detail.

Outer[0] and Outer[2] are the number of divisions at the poles. Outer[1] and Outer[3] are the number of divisions at the vertical seams. Inner[0] and Inner[1] are the inside sphere detail.
Example: Whole-Sphere Subdivision

`spheresubd.tes`

```glsl
#version 400 compatibility
#extension GL_ARB_tessellation_shader : enable

uniform float uScale;

layout( quads, equal_spacing, ccw ) in;

patch in float tcRadius;
patch in vec3 tcCenter;

out vec3 teNormal;

const float PI = 3.14159265;

void main( )
{
    vec3 p = gl_in[0].gl_Position.xyz;

    float u = gl_TessCoord.x;
    float v = gl_TessCoord.y;
    float w = gl_TessCoord.z;

    float phi = PI * ( u - .5 );
    float theta = 2. * PI * ( v - .5 );

    float cosphi = cos(phi);
    vec3 xyz = vec3( cosphi*cos(theta), sin(phi), cosphi*sin(theta) );
    teNormal = xyz;

    xyz *= ( uScale * tcRadius );
    xyz += tcCenter;

    gl_Position = gl_ModelViewMatrix * vec4( xyz,1. );
}
```

Turning u and v into spherical coordinates:

\[- \frac{\pi}{2} \leq \phi \leq + \frac{\pi}{2} \]

\[- \pi \leq \theta \leq + \pi \]
Example: Whole-Sphere Subdivision

Detail=30, Scale=1.

Detail=50, Scale=1.

Detail=50, Scale=2.5
#version 400 compatibility
#extension GL_ARB_tessellation_shader : enable

in float vRadius[ ];
in vec3 vCenter[ ];

patch out float tcRadius;
patch out vec3 tcCenter;

uniform float uDetail;layout( vertices = 1 ) out;

void main( )
{
    gl_out[ gl_InvocationID ].gl_Position = gl_in[ 0 ].gl_Position; // (0,0,0,1)
    tcCenter = vCenter[ 0 ];
tcRadius = vRadius[ 0 ];

vec4 mx = vec4( vCenter[0] - vec3( vRadius[0], 0., 0. ), 1. );
vec4 px = vec4( vCenter[0] + vec3( vRadius[0], 0., 0. ), 1. );
vec4 my = vec4( vCenter[0] - vec3( 0., vRadius[0], 0. ), 1. );
vec4 py = vec4( vCenter[0] + vec3( 0., vRadius[0], 0. ), 1. );
vec4 mz = vec4( vCenter[0] - vec3( 0., 0., vRadius[0] ), 1. );
vec4 pz = vec4( vCenter[0] + vec3( 0., 0., vRadius[0] ), 1. );

Extreme points of the sphere
Making the Whole-Sphere Subdivision Adapt to Screen Coverage

sphereadapt.tcs, II

```c
mx = gl_ModelViewProjectionMatrix * mx;
px = gl_ModelViewProjectionMatrix * px;
my = gl_ModelViewProjectionMatrix * my;
py = gl_ModelViewProjectionMatrix * py;
mz = gl_ModelViewProjectionMatrix * mz;
pz = gl_ModelViewProjectionMatrix * pz;

mx.xy /= mx.w;
px.xy /= px.w;
my.xy /= my.w;
py.xy /= py.w;
mz.xy /= mz.w;
pz.xy /= pz.w;

float dx = distance( mx.xy, px.xy );
float dy = distance( my.xy, py.xy );
float dz = distance( mz.xy, pz.xy );
float dmax = sqrt( dx*dx + dy*dy + dz*dz );

gl_TessLevelOuter[0] = 2.;
gl_TessLevelOuter[1] = dmax * uDetail;
gl_TessLevelOuter[2] = 2.;
gl_TessLevelOuter[3] = dmax * uDetail;
gl_TessLevelInner[0] = dmax * uDetail;
gl_TessLevelInner[1] = dmax * uDetail;
```

We no longer use uScale or tcRadius. But, we do use uDetail to provide a way to convert from NDC to Screen Space or to indicate the quality you’d like (I.e., uDetail depends on how good you want the spheres to look and on how large the window is in pixels.)
Making the Whole-Sphere Subdivision Adapt to Screen Coverage

spheredadapt.tes

```glsl
#version 400 compatibility
#extension GL_ARB_tessellation_shader : enable

layout( quads, equal_spacing, ccw) in;

patch in float   tcRadius;
patch in vec3   tcCenter;

out vec3          teNormal;

const float PI = 3.14159265;

void main( )
{
    vec3 p = gl_in[0].gl_Position.xyz;

    float u = gl_TessCoord.x;
    float v = gl_TessCoord.y;
    float w = gl_TessCoord.z;

    float phi = PI * ( u - .5 );
    float theta = 2. * PI * ( v - .5 );

    float cosphi = cos(phi);
    vec3 xyz = vec3( cosphi*cos(theta), sin(phi), cosphi*sin(theta) );
    teNormal = xyz;

    xyz *=  tcRadius;
    xyz += tcCenter;

    gl_Position = gl_ModelViewMatrix * vec4( xyz,1. );
}
```

Spherical coordinates

No longer uses uScale
Notice that the number of triangles adapts to the screen coverage of each sphere, and that the size of the tessellated triangles stays about the same, regardless of radius or transformation.
Example: PN Triangles

General idea: turn each triangle into a triangular Bézier patch. Create the Bézier control points by using the surface normals at the corner vertices. The Bézier patch equation can then be interpolated to any level of tessellation.

Observation: triangles are usually passed in with points (P) and normals (N). Using this method, those triangles can be broken into a series of smoother triangles internally. AMD actually had this in their firmware before tessellation shaders made it unnecessary.

Example: PN Triangles

**pntriangles.vert**

```glsl
#version 400 compatibility
uniform float  uScale;
out vec3         vNormal;
void  main( )
{
    vec3 xyz = gl_Vertex.xyz;
    xyz *= uScale;
    gl_Position = gl_ModelViewMatrix * vec4( xyz, 1. );
    vNormal = normalize( gl_NormalMatrix * gl_Normal );
}
```

**pntriangles.tcs**

```glsl
#version 400 compatibility
#extension GL_ARB_tessellation_shader : enable
uniform int      uOuter, uInner;
uniform float    uScale;
layout( vertices = 3 )  out;
in vec3    vNormal[ ];
out vec3  tcNormals[ ];

void main( )
{
    tcNormals[ gl_InvocationID ] = vNormal[ gl_InvocationID ];
    gl_out[ gl_InvocationID ].gl_Position = gl_in[ gl_InvocationID ].gl_Position;

    gl_TessLevelOuter[0] = uScale * float(uOuter);
    gl_TessLevelOuter[1] = uScale * float(uOuter);
    gl_TessLevelOuter[2] = uScale * float(uOuter);
    gl_TessLevelInner[0] = uScale * float(uInner);
}
```
Example: PN Triangles

```cpp
#version 400 compatibility
#extension GL_ARB_tessellation_shader : enable
in vec3 tcNormals[];
out vec3 teNormal;
layout( triangles, equal_spacing, ccw ) in;

void main( )
{
    vec3 p1 = gl_in[0].gl_Position.xyz;
    vec3 p2 = gl_in[1].gl_Position.xyz;
    vec3 p3 = gl_in[2].gl_Position.xyz;

    vec3 n1 = tcNormals[0];
    vec3 n2 = tcNormals[1];
    vec3 n3 = tcNormals[2];

    float u = gl_TessCoord.x;
    float v = gl_TessCoord.y;
    float w = gl_TessCoord.z;

    vec3 b300 = p1;
    vec3 b030 = p2;
    vec3 b003 = p3;

    float w12 = dot( p2 - p1, n1 );
    float w21 = dot( p1 - p2, n2 );
    float w13 = dot( p3 - p1, n1 );
    float w31 = dot( p1 - p3, n3 );
    float w23 = dot( p3 - p2, n2 );
    float w32 = dot(p2 - p3, n3);
}
```
Example: PN Triangles

```cpp
vec3 b210 = ( 2.*p1 + p2 - w12*n1 ) / 3.;
vec3 b120 = ( 2.*p2 + p1 - w21*n2 ) / 3.;
vec3 b021 = ( 2.*p2 + p3 - w23*n2 ) / 3.;
vec3 b012 = ( 2.*p3 + p2 - w32*n3 ) / 3.;
vec3 b102 = ( 2.*p3 + p1 - w31*n3 ) / 3.;
vec3 b201 = ( 2.*p1 + p3 - w13*n1 ) / 3.;

vec3 ee = ( b210 + b120 + b021 + b012 + b102 + b201 ) / 6.;
vec3 vv = ( p1 + p2 + p3 ) / 3.;
vec3 b111 = ee + ( ee - vv ) / 2.;

vec3 xyz = 1.*b300*w*w*w + 1.*b030*u*u*u + 1.*b003*v*v*v +
            3.*b210*u*w*w + 3.*b120*u*u*w + 3.*b201*v*w*w +
            3.*b021*u*u*v + 3.*b102*v*v*w + 3.*b012*u*v*v +
            6.*b111*u*v*w;

float v12 = 2. * dot( p2-p1, n1+n2 ) / dot( p2-p1, p2-p1 );
float v23 = 2. * dot( p3-p2, n2+n3 ) / dot( p3-p2, p3-p2 );
float v31 = 2. * dot( p1-p3, n3+n1 ) / dot( p1-p3, p1-p3 );

vec3 n200 = n1;
vec3 n020 = n2;
vec3 n002 = n3;
vec3 n110 = normalize( n1 + n2 - v12*(p2-p1) );
vec3 n011 = normalize( n2 + n3 - v23*(p3-p2) );
vec3 n101 = normalize( n3 + n1 - v31*(p1-p3) );
Normal = n200*w*w + n020*u*u + n002*v*v +
         n110*w*u + n011*u*v + n101*w*v;

gl_Position = vec4( xyz, 1. );
```
Example: PN Triangles

```glsl
#version 400 compatibility
#extension GL_gpu_shader4: enable
#extension GL_geometry_shader4: enable

uniform float   uShrink;
in vec3            teNormal[ ];
out float          gLightIntensity;
const vec3     LIGHTPOS = vec3( 5., 10., 10. );

vec3 V[3];
vec3 CG;

void
ProduceVertex( int v )
{
    gLightIntensity = abs( dot( normalize(LIGHTPOS - V[v]), normalize(teNormal[v]) )
    );
    gl_Position = gl_ProjectionMatrix* vec4( CG + uShrink * ( V[v] - CG ), 1. );
    EmitVertex( );
}

void main( )
{
    V[0]  =   gl_PositionIn[0].xyz;
    V[1]  =   gl_PositionIn[1].xyz;
}

    ProduceVertex( 0 );
    ProduceVertex( 1 );
    ProduceVertex( 2 );
```
Example: PN Triangles

```
#version 400 compatibility

in float gLightIntensity;

const vec3 COLOR = vec3(1., 1., 0.);

void main( )
{
    gl_FragColor = vec4( gLightIntensity*COLOR, 1. );
}
```

pntriangles.frag
The Cow’s Tail is a Good Example of using PN Triangles

Notice how much improvement there is just by increasing the outer tessellation. This is because smooth shading already helps the inner parts of triangles, but does nothing for the silhouettes.

uOuter = 1, uInner = 1

uOuter = 2, uInner = 1

uOuter = 2, uInner = 2

uOuter = 2, uInner = 2
The Difference Between Tessellation Shaders and Geometry Shaders

By now, you are probably confused about when to use a Geometry Shader and when to use a Tessellation Shader. Both are capable of creating new geometry from existing geometry. See if this helps.

Use a **Geometry Shader** when:

1. You need to convert an input topology into a *different output topology*, such as in the silhouette and hedgehog shaders (triangles→lines) or the explosion shader (triangles→points)

2. You need some sort of geometry processing to come after the Tessellation Shader (such as how the shrink shader was used).

Use a **Tessellation Shader** when:

1. One of the built-in tessellation patterns will suit your needs.

2. You need more than 6 input vertices to define the surface being tessellated.

3. You need more output vertices than a Geometry Shader can provide.
This tessellation is using 64x64 (the maximum allowed).

This is pretty good-looking, but doesn’t come close to using the full 4096x2276 resolution available for the bump-map.
