Parallel Programming
Course Introduction for those Taking it Online

Oregon State University
Mike Bailey
mjb@cs.oregonstate.edu
What this Course Is

This course is all about parallel programming on the desktop for applications that you are attempting to accelerate to improve user interaction and simulation and computational performance.

The goals of this course are to leave you “career-ready” (i.e., both work-ready and research-ready) for tasks that require desktop parallelism, both on a CPU and a GPU. CS 475/575 topics include:

- Parallel computing: types, limitations
- Moore’s Law, Amdahl’s Law
- OpenMP
- Synchronization issues in parallel computing
- Cache issues in parallel computing
- SIMD
- GPU computing
- OpenCL
- CUDA

What this Course Isn’t

This course is not about supercomputers or clusters. A lot of the same principles that we will discuss about the desktop do apply to supercomputers and clusters so this will still be useful.

However, if we have time, we will lightly touch on the Message Passing Interface, MPI, which is used in supercomputers and clusters.
This course is being taught by:

Professor Mike Bailey  
OSU Computer Science  
2117 Kelley Engineering Center  
mjb@cs.oregonstate.edu  
541-737-2542

Mike has had over 30 years experience in the computer graphics and high performance computing worlds. He has taught over 100 university classes to a total of over 7,000 students. He has also taught over 90 professional short courses around the world.

In his spare time, he … oh, wait, there is none. Well, that’s not quite true. He does like to read. In the spare time within all of that, he dabbles in K-12 outreach, particularly where he can apply computer graphics to it. Does that count as “spare time” or “more work”? 😊
Office Hours and Other Help

Sadly, I am a compulsive email checker. That is the best way to reach me. However, I am not necessarily a compulsive email-returner. I prioritize my email returns. Please do not email me over small things that you really can either look up or figure out for yourself (like “When is the assignment due?”). Those emails get low priority. The really serious concept email questions get high priority.

I am a compulsive telephone ignorer. That is not a good way to reach me consistently. I will return messages, but it might take a while. Email is better. This is not meant to be a disrespectful thing. It’s just that I am in and out of my office a lot, and when I am in, there are usually students in there with me.

I will hold Office Hours over the Internet on WebEx. I have my own “room”. Its URL is:

https://oregonstate.webex.com/meet/mjboregonstate.edu

It’s only available when I am there to “open it up” (not unlike a real room). To use this, you will need a microphone and speakers. I recommend a headset. They pickup less background noise than a microphone does and it gives you better sound than a speaker does. I found a nice inexpensive one at Radio Shack, which, unfortunately no longer exists. But, somewhere like it should be good.

I would love it if you also have a webcam, because then I can see you and get to know you a little better. And, because I often do these Office Hours from home, I sometimes get a little “help” from the following characters …
... Some Other Characters You Might “Meet”

**Loki**
Loki is a 12-year-old 90-pound dog who thinks he is still a puppy. He will probably stop by to be petted when I’m holding WebEx Office Hours.

**Callie**
Callie is very shy. If you came to my house, she would hide under a bed. But, through WebEx, she won’t know you are there. You might see her climbing around on my desk, you might not.

**Zelda**
Zelda is a 1-year-old puppy with bundles of energy. I am pretty sure you will see her run by the webcam during home Office Hours, but she might be just blur.
What You Should Know on the Way In: the Course Incoming Expectations

Above all, you should be a good C programmer. Being comfortable with function calls, arrays, for-loops, structures, arrays of structures, structures of arrays, pointers, and linked lists is a must. It is strongly suggested that you not use this class as an opportunity to learn C for the first time.

On the math side. You should know algebra. There will be times when we have an equation that solves for “Y given X” and I will ask, “What if we already know Y, can we then go back and find X?” It would be good if you can do that.
What We Will Be Covering

Note: this schedule is *approximate*!
I will try to keep the schedule on the class web site up-to-date.

<table>
<thead>
<tr>
<th>Week</th>
<th>Topics</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Introduction. Syllabus. What this course is ... and isn't. Project notes: timing, graphing. Examples. Parallel programming background information. The three things we care about Parallel Processing for. Von Neumann architecture. Multithreading</td>
</tr>
<tr>
<td>Week</td>
<td>Topics</td>
</tr>
<tr>
<td>------</td>
<td>--------</td>
</tr>
<tr>
<td>4</td>
<td>Caches, cont. False sharing. Designing parallel programs</td>
</tr>
<tr>
<td>5</td>
<td>Tasks. Barriers. A special kind of parallelism: Single Instruction Multiple Data (SIMD). SSE, AVX, AVX-512 instructions: what they are, how to use them. Types of problems that work this way. Test #1</td>
</tr>
<tr>
<td>6</td>
<td>Go over the test answers. GPU 101. Architecture. What GPUs are good at. What they are not good at. Why.</td>
</tr>
</tbody>
</table>
## What We Will Be Covering

| 7    | OpenCL Events  
OpenCL Reduction. |
| 8    | CUDA |
| 9    | OpenCL / OpenGL Interoperability  
Looking at OpenCL Assembly Language |
| 10   | Message Passing Interface (MPI)  
More Information |
There is no textbook for this class. The course material will consist of handouts and notes taken while watching the videos.

If you need further reference material, there are a bunch of links at the end of the class web site. You’re not required to go look at any of these. They are just some links that I have found useful. They are there if you need them.
I would love to do this whole class in Canvas-only. There is a lot to be said for consistency of interface. But, Canvas has certain things it can’t do.

For example, you will use Teach (http://engr.oregonstate.edu/teach) to turn in your assignments. Because I can write scripts behind this system to extract parts of your submissions, I can grade them, and give you feedback a lot faster. Canvas will not let me do that.

So, we will use Canvas for a lot of things, but not all.
