In OpenGL

OpenGL puts all uniform data in the same "set", but with different binding numbers, so you can get at each one.

Each uniform variable gets updated one-at-a-time.

Wouldn't it be nice if we could update a bunch of related uniform variables all at once?

```
layout( std140, binding = 0 )  uniform mat4      uModelMatrix;
layout( std140, binding = 1 ) uniform mat4       uViewMatrix;
layout( std140, binding = 2 ) uniform mat4       uProjectionMatrix;
layout( std140, binding = 3 ) uniform mat3       uNormalMatrix;
layout( std140, binding = 4 ) uniform vec4       uLightPos;
layout( std140, binding = 5 ) uniform float      uTime;
layout( std140, binding = 6 ) uniform  int       uMode;
layout(         binding = 7 ) uniform sampler2D uSampler;
```

In OpenGL, these are all in one set. They all get bound, whether you need them here or not.

What are Descriptor Sets?

Descriptor Sets are an intermediate data structure that tells shaders how to connect information held in GPU memory to groups of related uniform variables and texture sampler declarations in shaders. There are three advantages in doing things this way:

1. Related uniform variables can be updated as a group, gaining efficiency.
2. Descriptor Sets are activated when the Command Buffer is filled. Different values for the uniform buffer variables can be toggled by just swapping out the Descriptor Set that points to GPU memory, rather than re-writing the GPU memory.
3. Values for the shaders' uniform buffer variables can be compartmentalized into what quantities change often and what change seldom (scene-level, model-level, draw-level), so that uniform variables need to be re-written no more often than is necessary.

```
for( each scene )
{
    Bind Descriptor Set #0
    for( each object )
    {
        Bind Descriptor Set #1
        for( each draw )
        {
            Bind Descriptor Set #2
            Do the drawing
        }
    }
}
```

Descriptor Sets

Our example will assume the following shader uniform variables:

```
// non-opaque must be in a uniform block:
layout( std140, set = 0, binding = 0 ) uniform matBuf
{
        mat4 uModelMatrix;
        mat4 uViewMatrix;
        mat4 uProjectionMatrix;
        mat3 uNormalMatrix;
} Matrices;

layout( std140, set = 1, binding = 0 ) uniform lightBuf
{
        float  uKa, uKd, uKs, uShininess;
        vec4 uLightPos;
        vec4 uLightSpecularColor;
        vec4 uEyePos;
} Light;

layout( std140, set = 2, binding = 0 ) uniform miscBuf
{
        float  uTime;
        int    uMode;
        int    uLighting;
} Misc;

layout( set = 3, binding = 0 ) uniform sampler2D uSampler;
```

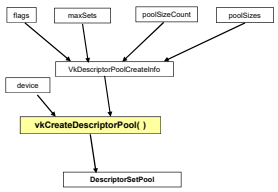
Step 1: Descriptor Set Pools

You don't allocate Descriptor Sets on the fly – that is too slow. Instead, you allocate a "pool" of Descriptor Sets and then pull from that pool later.



Oregon State University Computer Graphics

```
VkResult
Init13DescriptorSetPool( )
{
    VkResult result;

    VkDescriptorPoolSize                vdps[4];
        vdps[0].type = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER;
        vdps[0].descriptorCount = 1;
        vdps[1].type = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER;
        vdps[1].descriptorCount = 1;
        vdps[2].type = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER;
        vdps[2].descriptorCount = 1;
        vdps[3].type = VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER;
        vdps[3].descriptorCount = 1;

#endif

    VkDescriptorPoolCreateInfo          vdpci;
        vdpci.sType = VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO;
        vdpci.pNext = nullptr;
        vdpci.flags = 0;
        vdpci.maxSets = 4;

        vdpci.pPoolSizes = &vdps[0];

    result = vkCreateDescriptorPool( LogicalDevice, IN &vdpci, PALLOCATOR, OUT &DescriptorPool);
    return result;
}
```

Step 2: Define the Descriptor Set Layouts

I think of Descriptor Set Layouts as a kind of "Rosetta Stone" that allows the Graphics Pipeline data structure to allocate room for the uniform variables and to access them.
