Aliasing

The Display We Want

Too often, the Display We Get
“Aliasing” is a signal-processing term for “under-sampled compared with the frequencies in the signal”.

What the signal really is: what we want

What we think the signal is: too often, what we get

The Nyquist Criterion

“The Nyquist [sampling] rate is twice the maximum component frequency of the function [i.e., signal] being sampled.” -- WikiPedia
MultiSampling

Oversampling is a computer graphics technique to improve the quality of your output image by looking inside every pixel to see what the rendering is doing there.

There are two approaches to this:

1. **Supersampling**: Pick some number of sub-pixels within that pixel that pass the depth and stencil tests. Render the image at each of these sub-pixels.

2. **Multisampling**: Pick some number of sub-pixels within that pixel that pass the depth and stencil tests. If any of them pass, then perform a single color render for the one pixel and assign that single color to all the sub-pixels that passed the depth and stencil tests.

The final step will be to average those sub-pixels’ colors to produce one final color for this whole pixel. This is called *resolving* the pixel.

Consider Two Triangles Who Pass Through the Same Pixel

Let’s assume (for now) that the two triangles don’t overlap – that is, they look this way because they butt up against each other.
Supersampling

Final Pixel Color = \frac{\sum_{i=1}^{8} \text{Color sample from subpixel}_i}{8}

# Fragment Shader calls = 8
Multisampling

\[
\text{Final Pixel Color} = \frac{3 \times \text{One color sample from A} + 5 \times \text{One color sample from B}}{8}
\]

# Fragment Shader calls = 2

Consider Two Triangles Who Pass Through the Same Pixel

**Q:** What if the blue triangle completely filled the pixel when it was drawn, and then the red one, which is closer to the viewer than the blue one, came along and partially filled the pixel?

**A:** The ideas are all still the same, but the blue one had to deal with 8 sub-pixels (instead of 5 like before). But, the red triangle came along and obsoleted 3 of those blue sub-pixels. Note that the “resolved” image will still turn out the same as before.

At least this fraction of samples will get their own fragment shader calls (as long as they pass the depth and stencil tests).
