PipelineBarriers.pptx mjb – February 26, 2023

1

**Why Do We Need Pipeline Barriers?**

A series of `vkCmdxxx()` calls are meant to run "flat-out", that is, as fast as the Vulkan runtime can get them executing. But, many times, that is not desirable because the output of one command might be needed as the input to a subsequent command.

Pipeline Barriers solve this problem by declaring which stages of the hardware pipeline in subsequent `vkCmdyyy()` calls need to wait until which stages in previous `vkCmdxxx()` calls are completed.

  
**Oregon State University**  
 Computer Graphics

mjb – February 26, 2023

2

**Potential Memory Race Conditions that Pipeline Barriers can Prevent**

3

1. Read-after-Write (R-a-W) – the memory write in one operation starts overwriting the memory that another operation's read needs to use.
2. Write-after-Read (W-a-R) – the memory read in one operation hasn't yet finished before another operation starts overwriting that memory.
3. Write-after-Write (W-a-W) – two operations start overwriting the same memory and the end result is non-deterministic.

**Note:** there is no problem with Read-after-Read (R-a-R) as no data gets changed.

vkCmdSetStencilReference	vkCmdWriteAccelerationStructuresProperties
vkCmdSetStencilTestEnable	vkCmdWriteBufferMarker2
vkCmdSetStencilWriteMask	vkCmdWriteBufferMarker
vkCmdSetVertexInput	vkCmdWriteTimestamp
vkCmdSetViewport	vkCmdWriteTimestamp2
vkCmdSetViewportShadingRatePalette	
vkCmdSetViewportWithCount	
vkCmdSetViewportWScaling	

7

vkCmdPipelineBarrier( ) Function Call

A Pipeline Barrier is a way to establish a dependency between commands that were submitted before the barrier and commands that are submitted after the barrier

```
vkCmdPipelineBarrier( commandBuffer,
    srcStageMask,  
        Guarantees that this pipeline stage is completely done being used by  
        the previous vkCmdxxx before ...
    dstStageMask,  
        ... allowing this pipeline stage to be used by the next vkCmdyyy
    VK_DEPENDENCY_BY_REGION_BIT,
    memoryBarrierCount, pMemoryBarriers,
    bufferMemoryBarrierCount, pBufferMemoryBarriers,
    imageMemoryBarrierCount, pImageMemoryBarriers
);  
  
Defines what data we will be  
blocking on or un-blocking on
```

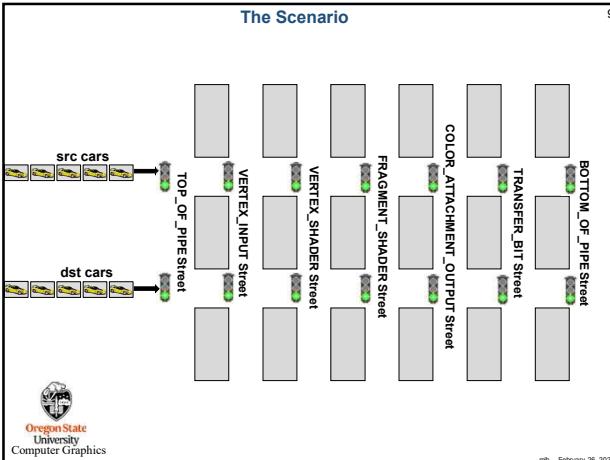

The hope is to maximize the number of unblocked stages:  
produce data early and consume data late

mb - February 26, 2023

8

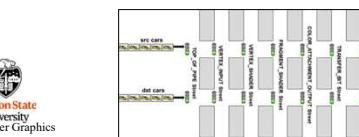

The Scenario

9

The Scenario

1. The cross-streets are named after pipeline stages
2. All traffic lights start out green
3. There are special sensors at all intersections that will know when **any car in the src group** is in that intersection
4. There are connections from those sensors to the traffic lights so that when **any car in the src group** is in the intersection, the proper **dst** traffic lights will be turned red
5. When the **last car in the src group** completely makes it through its intersection, the proper **dst** traffic lights are turned back to green
6. The Vulkan command pipeline ordering is this: (1) the **src** cars get released by the previous vkCmdxxx, (2) the pipeline barrier is invoked (which turns some lights red), (3) the **dst** cars get released by the next vkCmdyyy, (4) the **dst** cars stop at the red light, (5) the **src** cars clear the intersection, (6) the **dst** lights turn green, (6) the **dst** cars continue.
