Specialization Constants

In Vulkan, all shaders get halfway-compiled by SPIR-V and then the rest-of-the-way compiled by the Vulkan driver.

Normally, the half-way compile fixes all constant values and compiles the code that uses them.

But, it would be nice every so often to have your Vulkan program sneak into the halfway-compiled binary and manipulate some constants at runtime. This is what Specialization Constants are for. A Specialization Constant is a way of injecting an integer, Boolean, uint, float, or double constant into an halfway-compiled version of a shader right before the rest-of-the-way compilation.

That final compilation happens when you call `vkCreateComputePipelines()`.

Without Specialization Constants, you would have to commit to a final value before the SPIR-V compile was done, which could have been a long time ago.

Specialization Constants could be used for:

- Setting the work-items per work-group in a compute shader
- Setting a Boolean flag and then eliminating the if-test that used it
- Setting an integer constant and then eliminating the switch statement that looked for it
- Making a decision to unroll a for-loop because the number of passes through it are small enough
- Collapsing arithmetic expressions into a single value
- Collapsing trivial simplifications, such as adding by zero or multiplying by 1
Specialization Constants are Described in the Compute Pipeline

```
#layout(constant_id = 7) const int ASIZE = 32;
int array[ASIZE];
```

In the compute shader:

```
// one array element for each Specialization Constant
vsme[0].constantID = 7;
vsme[0].offset = 0; // # bytes into the Specialization Constant array this one item is
vsme[0].size = sizeof(ASIZE); // size of just this Specialization Constant
```

In the Vulkan C/C++ program:

```
int asize = 64;
VkSpecializationMapEntry vsme[1];
// one array element for each Specialization Constant
vsme[0].constantID = 7;
vsme[0].offset = 0;
vsme[0].size = sizeof(ASIZE); // size of just this Specialization Constant
VkSpecializationInfo vsi;
// array of all the Specialization Constants
vsi.pData = &asize;
```

In the compute shader:

```
// one array element for each Specialization Constant
vsme[1].constantID = 7;
vsme[1].offset = 0;
vsme[1].size = sizeof(ASIZE); // size of just this Specialization Constant
```

In the Vulkan C/C++ program:

```
int asize = 64;
VkSpecializationMapEntry vsme[1];
// one array element for each Specialization Constant
vsme[0].constantID = 7;
vsme[0].offset = 0;
vsme[0].size = sizeof(ASIZE); // size of just this Specialization Constant
VkSpecializationInfo vsi;
vsi.mapEntryCount = 1;
vsi.pMapEntries = &vsme[0];
vsi.pData = &asize; // size of all the Specialization Constants together
```

Specialization Constant Example -- Setting Multiple Constants

In the compute shader:

```
#layout(constant_id = 9) const int a = 1;
#layout(constant_id = 10) const int b = 2;
#layout(constant_id = 11) const float c = 3.14;
```

In the C/C++ program:

```
struct abc { int a, int b, float c; } abc;
```

Linking the Specialization Constants into the Compute Pipeline

```
int asize = 64;
VkSpecializationMapEntry vsme[3];
// array of all the Specialization Constants
vsme[0].constantID = 9;
vsme[0].offset = offsetof(abc, a);
vsme[0].size = sizeof(abc.a);
vsme[1].constantID = 10;
vsme[1].offset = offsetof(abc, b);
vsme[1].size = sizeof(abc.b);
vsme[2].constantID = 11;
vsme[2].offset = offsetof(abc, c);
vsme[2].size = sizeof(abc.c);
VkSpecializationInfo vsi;
vsi.mapEntryCount = 3;
vsi.pMapEntries = &vsme[0];
vsi.pData = &abc; // array of all the Specialization Constants
```
Specialization Constants – Setting the Number of Work-items Per Work-Group in the Compute Shader

In the compute shader:

```glsl
layout(local_size_x_id=12) in;
layout(local_size_x = 32, local_size_y = 1, local_size_z = 1) in;
```

In the C/C++ program:

```c
int numXWorkItems = 64;
VkSpecializationMapEntry vsme[1];
vsme[0].constantID = 12;
vsme[0].offset = 0;
vsme[0].size = sizeof(int);
VkSpecializationInfo vsi;
vsi.mapEntryCount = 1;
vsier.pMapEntries = &vsme[0];
vsier.dataSize = sizeof(int);
vsier.pData = &numXWorkItems;
```
