A Useful Concept: Spherical Linear Interpolation

$$Q^t(t) = \frac{\sin(1-t)\phi}{\sin \phi} P + \frac{\sin t\phi}{\sin \phi} Q$$

$$0. \leq t \leq 1.$$

where:

$$\cos \phi = P \cdot Q = (p_x q_x + p_y q_y + p_z q_z)$$

$$\sin \phi = \sqrt{1 - \cos^2 \phi}$$

A Review of Complex Numbers

$z = x + iy = r[\cos \theta + i \sin \theta] = r e^{i\theta}$

$z_1 z_2 = (x_1 + i y_1)(x_2 + i y_2) = r_1 e^{i\theta_1} r_2 e^{i\theta_2} = r_1 r_2 e^{i(\theta_1 + \theta_2)}$
(i.e., multiply the r's and add the theta's)

Since we are adding the theta's, we see that complex multiplication is really just rotation by theta if r = 1.

Complex conjugate:

$$z^* = r e^{-i\theta} = x - iy$$

Complex inverse:

$$z^{-1} = \frac{1}{r} e^{-i\theta}$$

Note:

- $(z)(z^*) = r^2$
- $(z)(z^{-1}) = 1.$
- If $r = 1.$, then $z^* = z^{-1}$

Quaternion Background

Discovered by Sir William Hamilton, 1843, while on a walk in Dublin.

Legend says that he was so excited that he took out a knife and carved the equation into the stone of a bridge.

Good thing spray-paint hadn't been invented yet...

Quaternions have 4 elements, one real and three complex:

$$Q = q_0 + i q_1 + j q_2 + k q_3 = (q_0, q_1, q_2, q_3) = (q_0, \vec{q})$$

By definition,

1 $ii = jj = kk = -1$	2 $ij = k, jk = i, ki = j$
3 $ji = -k, kj = -i, ik = -j$	4 $ijk = -1$

And, by definition, we always force $\|Q\| = 1.$ by making $q_0^2 + q_1^2 + q_2^2 + q_3^2 = 1$

Quaternion Multiplication

5

$$PQ = (p_0 + i p_1 + j p_2 + k p_3)(q_0 + i q_1 + j q_2 + k q_3)$$

$$PQ = \begin{pmatrix} p_0 q_0 - p_1 q_1 - p_2 q_2 - p_3 q_3 \\ p_1 q_0 + p_0 q_1 + p_2 q_3 - p_3 q_2 \\ p_2 q_0 + p_0 q_2 + p_3 q_1 - p_1 q_3 \\ p_3 q_0 + p_0 q_3 + p_1 q_2 - p_2 q_1 \end{pmatrix} \begin{matrix} i \\ j \\ k \end{matrix}$$

$-\vec{p} \cdot \vec{q}$
 $q_0 \vec{p} \quad p_0 \vec{q} \quad \vec{p} \times \vec{q}$

mjb - February 21, 2018

Performing Rotations with Quaternions

6

A Quaternion can record a rotation transformation by an angle θ about an axis \hat{n} like this:

$$[R(\theta, \hat{n})] = [Q(q_0, \vec{q})]$$

where:

$$q_0 = \cos(\theta/2)$$

$$\vec{q} = \sin(\theta/2)\hat{n}$$

Concatenated Quaternion Rotations are handled like this:

$$R'(\theta, \hat{n}) = R_2(\theta_2, \hat{n}_2) * R_1(\theta_1, \hat{n}_1) \quad \leftarrow R_1\text{'s rotation takes effect first, followed by } R_2\text{'s}$$

A Quaternion can represent a point P like this:

$$P = Q(0, \vec{p}) = (0, p_x, p_y, p_z)$$

A rotated point, P' by one rotation is: $P' = [R] * \{P\} * [R]^{-1}$

A rotated point, P' by multiple rotations is: $P' = [R_2][R_1] * \{P\} * [R_1]^{-1}[R_2]^{-1}$

Converting from a Quaternion to a Matrix

7

$$R(Q) = \begin{bmatrix} q_0^2 + q_1^2 - q_2^2 - q_3^2 & 2q_1q_2 - 2q_0q_3 & 2q_1q_3 + 2q_0q_2 \\ 2q_1q_2 + 2q_0q_3 & q_0^2 - q_1^2 + q_2^2 - q_3^2 & 2q_2q_3 - 2q_0q_1 \\ 2q_1q_3 - 2q_0q_2 & 2q_2q_3 + 2q_0q_1 & q_0^2 - q_1^2 - q_2^2 + q_3^2 \end{bmatrix}$$

mjb - February 21, 2018

From the GLM Notes: The Rotation Matrix for an Angle (θ) about an Arbitrary Axis (A_x, A_y, A_z)

8

$$[M] = \begin{bmatrix} A_x A_x + \cos \theta (1 - A_x A_x) & A_x A_y - \cos \theta (A_x A_y) - \sin \theta A_z & A_x A_z - \cos \theta (A_x A_z) + \sin \theta A_y \\ A_x A_y - \cos \theta (A_x A_y) + \sin \theta A_z & A_y A_y + \cos \theta (1 - A_y A_y) & A_y A_z - \cos \theta (A_y A_z) - \sin \theta A_x \\ A_x A_z - \cos \theta (A_x A_z) - \sin \theta A_y & A_y A_z - \cos \theta (A_y A_z) + \sin \theta A_x & A_z A_z + \cos \theta (1 - A_z A_z) \end{bmatrix}$$

For this to be correct, A must be a unit vector

mjb - February 21, 2018

Converting from a Quaternion to a Matrix 9

$$R(Q) = \begin{bmatrix} q_0^2 + q_1^2 - q_2^2 - q_3^2 & 2q_1q_2 - 2q_0q_3 & 2q_1q_3 + 2q_0q_2 \\ 2q_1q_2 + 2q_0q_3 & q_0^2 - q_1^2 + q_2^2 - q_3^2 & 2q_2q_3 - 2q_0q_1 \\ 2q_1q_3 - 2q_0q_2 & 2q_2q_3 + 2q_0q_1 & q_0^2 - q_1^2 - q_2^2 + q_3^2 \end{bmatrix}$$

$$R = \begin{bmatrix} c + n_x^2(1-c) & n_xn_y(1-c) - sn_z & n_xn_y(1-c) + sn_y \\ n_y n_x(1-c) + sn_z & c + n_y^2(1-c) & n_y n_z(1-c) - sn_x \\ n_z n_x(1-c) - sn_y & n_z n_y(1-c) + sn_x & c + n_z^2(1-c) \end{bmatrix}$$

where: $c = \cos\theta$
 $s = \sin\theta$

Note that the sum of the Trace (diagonal) elements is: $3c + (1-c) = 1 + 2\cos\theta$

mjb - February 21, 2018

Converting from a Matrix to a Quaternion 10

$$R(Q) = \begin{bmatrix} q_0^2 + q_1^2 - q_2^2 - q_3^2 & 2q_1q_2 - 2q_0q_3 & 2q_1q_3 + 2q_0q_2 \\ 2q_1q_2 + 2q_0q_3 & q_0^2 - q_1^2 + q_2^2 - q_3^2 & 2q_2q_3 - 2q_0q_1 \\ 2q_1q_3 - 2q_0q_2 & 2q_2q_3 + 2q_0q_1 & q_0^2 - q_1^2 - q_2^2 + q_3^2 \end{bmatrix}$$

Note that the sum of the Trace (diagonal) elements is: $3c + (1-c) = 1 + 2\cos\theta$

Letting $t = \text{Trace}(R) = 1 + 2\cos\theta$, then:

$$\cos\theta = \frac{1}{2}(t-1)$$

$$\sin\theta = \sqrt{1 - \cos^2\theta}$$

mjb - February 21, 2018

Notes from Converting from a Quaternion to a Matrix 11

$$R = \begin{bmatrix} c + n_x^2(1-c) & n_xn_y(1-c) - sn_z & n_xn_y(1-c) + sn_y \\ n_y n_x(1-c) + sn_z & c + n_y^2(1-c) & n_y n_z(1-c) - sn_x \\ n_z n_x(1-c) - sn_y & n_z n_y(1-c) + sn_x & c + n_z^2(1-c) \end{bmatrix}$$

$$R^T = \begin{bmatrix} c + n_x^2(1-c) & n_y n_x(1-c) + sn_z & n_z n_x(1-c) - sn_y \\ n_x n_y(1-c) - sn_z & c + n_y^2(1-c) & n_z n_y(1-c) + sn_x \\ n_x n_y(1-c) + sn_y & n_y n_z(1-c) - sn_x & c + n_z^2(1-c) \end{bmatrix}$$

$$R \cdot R^T = \begin{bmatrix} 0 & -2sn_z & +2sn_y \\ +2sn_z & 0 & -2sn_x \\ -2sn_y & +2sn_x & 0 \end{bmatrix}$$

$c = \cos\left(\frac{\theta}{2}\right)$
 $s = \sin\left(\frac{\theta}{2}\right)$

mjb - February 21, 2018

Converting from a Matrix to a Quaternion 12

$$R - R^T = \begin{bmatrix} 0 & -2n_z \sin\theta & +2n_y \sin\theta \\ +2n_z \sin\theta & 0 & -2n_x \sin\theta \\ -2n_y \sin\theta & +2n_x \sin\theta & 0 \end{bmatrix} = \begin{bmatrix} 0 & -c & b \\ c & 0 & -a \\ -b & a & 0 \end{bmatrix}$$

If we let $d = \sqrt{a^2 + b^2 + c^2}$, then $\hat{n} = \left(\frac{a}{d}, \frac{b}{d}, \frac{c}{d}\right)$

$$q_0 = \cos\left(\frac{\theta}{2}\right)$$

$$\bar{q} = \sin\left(\frac{\theta}{2}\right)\hat{n}$$

My Code (Quat.h, Quat.cpp)

16

```

Rotate
Slerp( float t, const Quat& p, const Quat& q )
{
    float angr; // angle between p and q in radians
    float c, s; // cosine and sine of the angle between p and q
    float cp, cq; // coefficients to multiply quaternions p and q
    Rotate r;

    // dot product to get the angle between p and q;
    c = p.s*q.s + p.vx*q.vx + p.vy*q.vy + p.vz*q.vz;
    angr = acos( c );

    // sine of that angle:
    s = sin( angr );

    // if the sine is 0., then p == q:
    if( s == 0. )
    {
        r = p;
        return r;
    }

    // do spherical interpolation:
    cp = sin( (1-t)*angr ) / s;
    cq = sin( t*angr ) / s;

    r = cp*p + cq*q;
    return r;
}
