void OsuSphere( float radius, int slices, int stacks )
{
    struct point top, bot;          // top, bottom points
    struct point *p;
    NumLngs = slices;
    NumLats = stacks;
    Pts = new struct point[ NumLngs * NumLats ];
    for( int ilat = 0; ilat < NumLats; ilat++ )
    {
        float lat = -M_PI/2. + M_PI * (float)ilat / (float)(NumLats-1);
        float xz = cos( lat );
        float y   = sin( lat );
        for( int ilng = 0; ilng < NumLngs; ilng++ )
        {
            float lng = -M_PI  +  2. * M_PI * (float)ilng / (float)(NumLngs-1);
            float x =  xz * cos( lng );
            float z = -xz * sin( lng );
            p = PtsPointer( ilat, ilng );
            p->x  = radius * x;
            p->y  = radius * y;
            p->z  = radius * z;
            p->nx = x;
            p->ny = y;
            p->nz = z;
            p->s  = ( lng + M_PI    ) / ( 2.*M_PI );
            p->t  = ( lat + M_PI/2. ) / M_PI;
        }
    }
}

Even worse, the trig calls are inside single or double-nested for-loops!
top.x = 0.;  top.y = radius;  top.z = 0.;
top.rx = 0.;  top.ny = 1.;  top.nz = 0.;
top.s = 0.;  top.t = 1.;
bot.x = 0.;  bot.y = -radius;  bot.z = 0.;
bot.rx = 0.;  bot.ny = -1.;  bot.nz = 0.;
bot.s = 0.;  bot.t = 0.;

  p = PtsPointer( 0, ilng+1 );
  DrawPoint( p );
  p = PtsPointer( 1, ilng+1 );
  DrawPoint( p );
  p = PtsPointer( 1, ilng );
  DrawPoint( p );
}
gEnd();

gBegin( GL_QUADS );
for( int ilat = 2; ilat < NumLats-1; ilat++ )
{
  for( int ilng = 0; ilng < NumLngs-1; ilng++ )
  {
    p = PtsPointer( ilat-1, ilng );
    DrawPoint( p );
    p = PtsPointer( ilat-1, ilng+1 );
    DrawPoint( p );
    p = PtsPointer( ilat, ilng+1 );
    DrawPoint( p );
    p = PtsPointer( ilat, ilng );
    DrawPoint( p );
  }
gEnd();
You don't want to execute all that code every time you want to redraw the scene, so draw it once, store the numbers in GPU memory, and call them back up later

Without a Display List:
The CPU re-computes and transmits the sphere coordinates every time they need to be drawn

With a Display List:
The CPU computes and transmits the sphere coordinates once and then they are grabbed from GPU memory every time they need to be drawn

You don't want to execute all that code every time you want to redraw the scene, so draw it once, store the numbers in GPU memory, and call them back up later

The solution is to incur the sphere-creation overhead once, and whenever the sphere needs to be re-drawn, just draw the saved numbers, not the equations. This is a Display List.

Creating the Display List in InitLists():

1. How many unique, unused, consecutive DL identifiers to give back to you

2. The ID of the first DL in the unique, unused list

// a global GLuint variable:
SphereList = glGenLists( 1 );
glNewList( SphereList, GL_COMPILE );
OsuSphere( 5., 30, 30 );
glEndList( );

3. Open up a display list in (GPU) memory

4. The coordinates, etc. end up in memory instead of being sent to the display

5. All done with storing the numbers in the DL

Calling up the Display List in Display():

glCallList( SphereList );

6. Pull all the coordinates, etc. from memory, just as if the code to generate them had been executed here
A Common Display List Misconception

Let's say that we are creating a rectangle in a Display List, like this:

```c
float L, W; // length and width global variables
int RectList; // rectangle display list

L = 10.; W = 5.;
glNewList( RectList, GL_COMPILE );
    /* draw a rectangle using L and W */
glEndList( );
```

Then, when we go to use the DL, we do this:

```c
L = 4.; W = 2.;
glCallList( RectList );
```

What size rectangle will it draw? 10x5? 4x2?

It will draw a 10x5 rectangle. Display Lists bake in the **numbers**. They retain no knowledge of what **variables** were used to create those numbers!
