Identify the Light Source Casting the Shadow

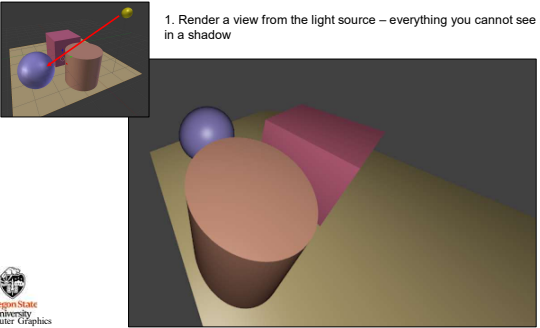

2

First, Render the Scene from that Light Source

1. Render a view from the light source – everything you cannot see must be in a shadow

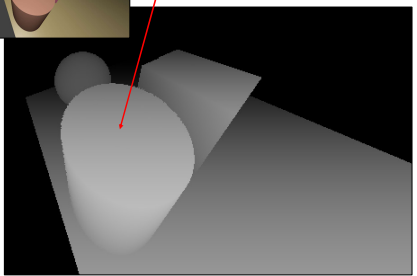

3

Use the Z-buffer as a Depth Shadow Map

2. Generate a depth view from the light source

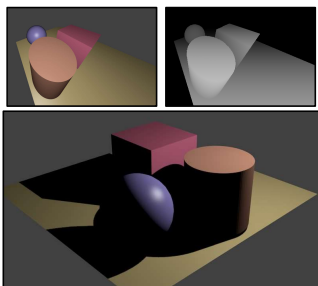

4

Second, Render the Scene as Normal, but Consult the Depth Map to Decide where Lighting Applies

3. Put the eye back where it really belongs. Render that view. Every time you create a pixel in the scene, compare its 3D location against the depth map. If the light-position camera could not see it before, don't allow lighting to be applied to it now.

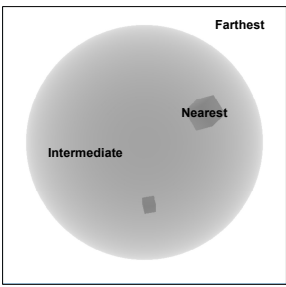

5

OpenGL Shadow Demo Program: The Depth Shadow Map

The depth shadow map is created from the point of view of the light source.

The rendering is done into an off-screen framebuffer and only renders the depth, not any colors.

In this grayscale image, dark colors are nearest to the eye, light colors are farther away.

6

OpenGL Demo Program: Creating the Off-screen Depth Shadow Map Framebuffer 7

```

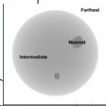

// create a framebuffer object and a depth texture object:
glGenFramebuffers(1, &DepthFramebuffer);
glGenTextures(1, &DepthTexture);

// Create a texture that will be the framebuffer's depth buffer
glBindTexture(GL_TEXTURE_2D, DepthTexture);
glTexImage2D(GL_TEXTURE_2D, 0, GL_DEPTH_COMPONENT, SHADOW_WIDTH, SHADOW_HEIGHT,
0, GL_DEPTH_COMPONENT, GL_FLOAT, NULL);
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER, GL_NEAREST);
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MAG_FILTER, GL_NEAREST);
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_S, GL_CLAMP_TO_EDGE);
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_T, GL_CLAMP_TO_EDGE);

// attach texture to framebuffer as depth buffer:
glBindFramebuffer(GL_FRAMEBUFFER, DepthFramebuffer);
glFramebufferTexture2D(GL_FRAMEBUFFER, GL_DEPTH_ATTACHMENT, GL_TEXTURE_2D, DepthTexture, 0);

// force OpenGL to accept a framebuffer that doesn't have a color buffer in it:
glDrawBuffer(GL_NONE);
glReadBuffer(GL_NONE);
glBindFramebuffer(GL_FRAMEBUFFER, 0);
