

2 Remember this from the Geometric Modeling Notes? GLuint CubeTriangleIndices[][3] = { 0, 2, 3 } { 0, 3, 1 }, { 4, 5, 7 }, { 4, 7, 6 }, { 1, 3, 7 }, { 1, 7, 5 }, static GLfloat CubeVertices[][3] = $\{0, 4, 6\},\$ $\{0, 6, 2\},\$ static GLfloat CubeColors[][3] = { -1., -1., -1. }, { 2, 6, 7 }, { 1., -1., -1.}, { 2, 7, 3 }, $\{0., 0., 0.\},\$ { -1., 1., -1. }, $\{0, 1, 5\}$ { 1., 0., 0. }, { 1., 1., -1.}, { 0, 5, 4 } { 0., 1., 0. }, { -1., -1., 1. }, **}**; { 1., 1., 0. }, { 1., -1., 1.}, { 0., 0., 1. }, {-1., 1., 1.}, { 1., 1., 1.} { 1., 0., 1. }, { 0., 1., 1. }, { 1., 1., 1. }, University Computer Graphics

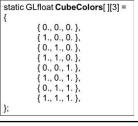

- Optionally store the connections on the graphics card too.
- Every time you go to redraw, coordinates will be pulled from GPU memory instead of CPU memory, avoiding a significant amount of bus latency.

Computer Graphics

Did any of you ever watch Star Trek: Deep Space Nine?

It was about life aboard a space station. Ships docked at Deep Space Nine to unload cargo and pick up supplies. When a ship was docked at docking port "**A**", for instance, the supply-loaders didn't need to know what ship it was. They could just be told, "send these supplies out docking port A", and "bring this cargo in from docking port A".

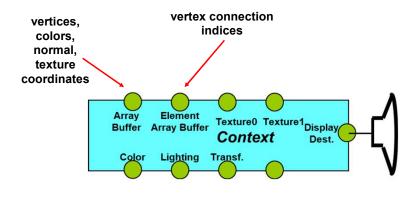

Surprisingly, this actually has something to do with computer graphics!

nib – August 30, 2024

The OpenGL Rendering Context

The OpenGL **Rendering Context** (also called "the **state**") contains all the characteristic information necessary to produce an image from geometry. This includes the current transformation, color, lighting, textures, where to send the display, etc.

Each window (e.g., glutCreateWindow) has its own rendering context.

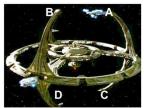

5

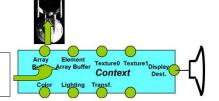

Computer Graphics

More Background – "Binding" to the Context

The OpenGL term "binding" refers to "attaching" or "docking" (a metaphor which I find to be more visually pleasing) an OpenGL object to the Context. You can then assign characteristics, and they will "flow in" through the Context into the object.

Vertex Buffer Object pointed to by bufA

glBindBuffer(GL_ARRAY_BUFFER, bufA);

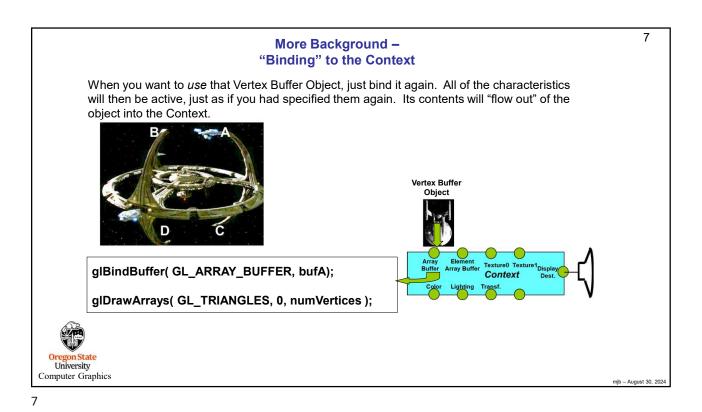

glBufferData(GL_ARRAY_BUFFER, numBytes, data, usage);

Ships docked at Deep Space Nine to unload cargo and pick up supplies. When a ship was docked at docking port "A", for instance, the supply-loaders didn't need to know what ship it was. They could just be told, "send these supplies out docking port A", and "pick up this cargo from docking port A".

mjb – August 30, 2024

6

8 More Background -How do you Create an OpenGL "Buffer Object"? When creating data structures in C++, objects are pointed to by their addresses. In OpenGL, objects are pointed to by an unsigned integer "handle". You can assign a value for this handle yourself (not recommended), or have OpenGL generate one for you that is guaranteed to be unique. For example: The "array" to put them in How many "handles" to GLuint bufA; generate glGenBuffers(1, &bufA); OpenGL then uses these handles to determine the actual GPU memory addresses to use. University Computer Graphics

Loading data into the currently-bound Vertex Buffer Object

9

glBufferData(type, numBytes, data, usage);

type is the type of buffer object this is:

Use GL_ARRAY_BUFFER to store floating point vertices, normals, colors, and texture coordinates

numBytes is the number of bytes to store all together. It's not the number of numbers, not the number of coordinates, not the number of vertices, but the number of *bytes*!

data is the memory address of (i.e., pointer to) the data to be transferred from CPU memory to the graphics memory. (This is allowed to be NULL, indicating that you will transfer the data over later.)

mjb - August 30, 2024

9

Loading data into the currently-bound Vertex Buffer Object

10

glBufferData(type, numBytes, data, usage);

usage is a hint as to how the data will be used: GL_xxx_yyy

where xxx can be:

STATIC this buffer will be re-written seldom DYNAMIC this buffer will be re-written often

and yyy can be:

DRAW this buffer will be used for drawing READ this buffer will be copied into

For what we are doing, use GL_STATIC_DRAW

mib - August 30, 2024

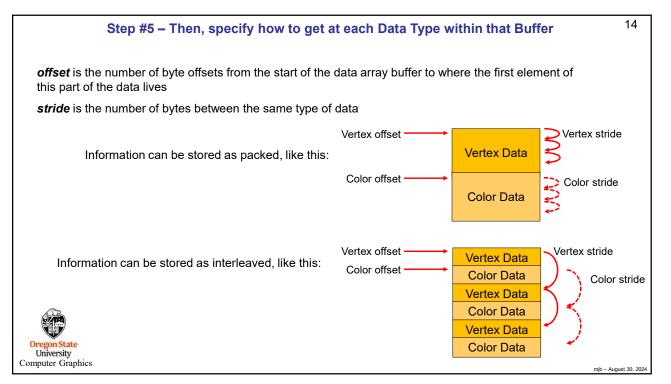

glEnableClientState(type); where type can be any of: GL_VERTEX_ARRAY GL_COLOR_ARRAY GL_NORMAL_ARRAY GL_TEXTURE_COORD_ARRAY • Call this as many times as you need to enable all the drawing data types that you are using. • To deactivate a type, call: glDisableClientState(type);

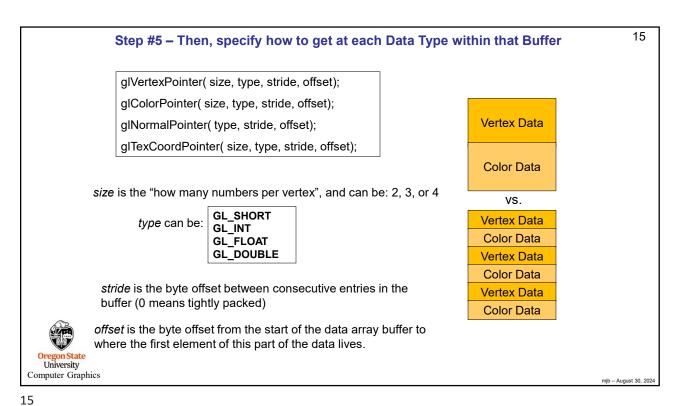

Step #4 – To start the drawing process, bind the Buffer that holds the Drawing Data

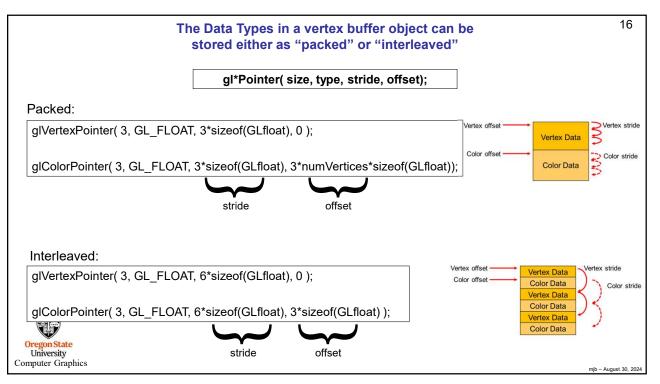

glBindBuffer(GL_ARRAY_BUFFER, bufA);

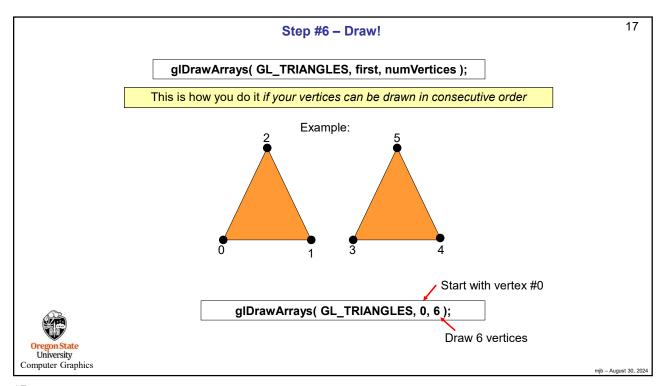

glBindBuffer(GL_ARRAY_BUFFER, bufA);

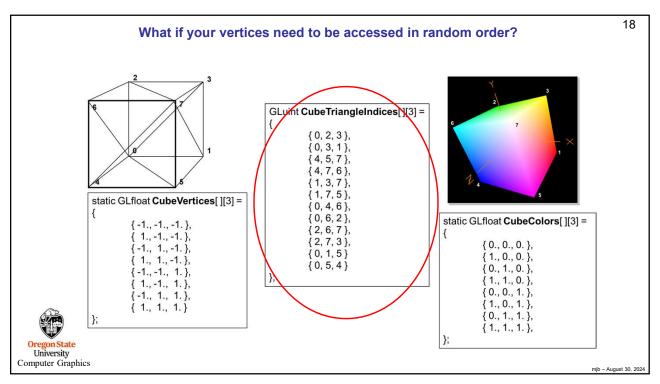

13

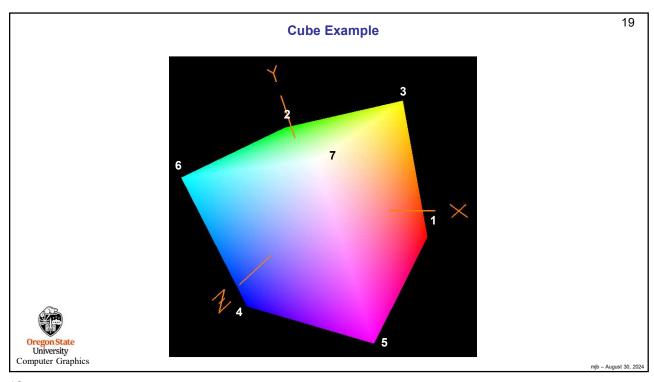

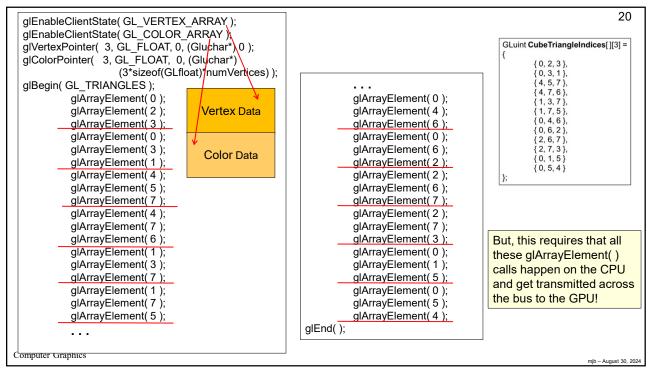

It would be better if that index array was stored over on the GPU as well

21

```
glBindBuffer( GL_ARRAY_BUFFER, bufA );
glBufferData( GL_ARRAY_BUFFER, 3*sizeof(GLfloat)*numVertices, CubeVertices, GL_STATIC_DRAW );
glBindBuffer( GL_ELEMENT_ARRAY_BUFFER, bufB );
glBufferData( GL_ELEMENT_ARRAY_BUFFER, sizeof(GLuint)*numIndices, CubeTriangleIndices, GL_STATIC_DRAW );
```

21

The glDrawElements() call

22

```
glBindBuffer( GL_ARRAY_BUFFER, bufA );
glBindBuffer( GL_ELEMENT_ARRAY_BUFFER, bufB );
glEnableClientState( GL_VERTEX_ARRAY );
glEnableClientState( GL COLOR ARRAY );
glVertexPointer(3, GL FLOAT, 0, (Gluchar*) 0);
glColorPointer( 3, GL_FLOAT, 0, (Gluchar*) (3*sizeof(GLfloat)*numVertices));
glDrawElements( GL_TRIANGLES, 36, GL_UNSIGNED_INT, (Gluchar*) 0 );
```

Writing Data into a Buffer Object, Treating it as a C/C++ Array of Structures

23

float * vertexArray = glMapBuffer(GL_ARRAY_BUFFER, usage);

usage is how the data will be accessed:

```
GL_READ_ONLY
                         the vertex data will be read from, but not written to
GL_WRITE_ONLY
                         the vertex data will be written to, but not read from
GL_READ_WRITE
                         the vertex data will be read from and written to
```

You can now use **vertexArray[**] like any other C/C++ floating-point array of structures.

When you are done, be sure to call:

glUnMapBuffer(GL_ARRAY_BUFFER);

mjb - August 30, 2024

23

```
glMapBuffer Example
struct Point
```

```
float x, y, z;
                                          float nx, ny, nz;
                                          float r, g, b;
                                          float s, t;
                                   };
                                    glGenBuffers( 1, &pbuffer );
                                    glBindBuffer( GL ARRAY BUFFER, pbuffer );
                                   glBufferData( GL_ARRAY_BUFFER, numPoints * sizeof(struct Point), NULL, GL_STATIC_DRAW); struct Point * parray = (struct Point *) glMapBuffer( GL_ARRAY_BUFFER, GL_WRITE_ONLY);
                                    for( int i = 0; i < numPoints; i++ )
                                                 parray[i].x = PointVec[i].x;
                                                 parray[i].y = PointVec[i].y;
parray[i].z = PointVec[i].z;
                                                 parray[i].nx = PointVec[i].nx;
                                                 parray[i].ny = PointVec[i].ny;
                                                 parray[i].nz = PointVec[i].nz;
parray[i].r = PointVec[i].r;
                                                 parray[i].g = PointVec[i].g;
                                                 parray[i].b = PointVec[i].b;
                                                 parray[i].s = PointVec[i].s;
parray[i].t = PointVec[i].t;
                                    glUnmapBuffer( GL_ARRAY_BUFFER );

                                           Vertex Buffer Object Class Methods
                                                       true means to not replicate common vertices in the internal vertex table.
      void CollapseCommonVertices( bool );
                                                       This is good if all uses of a particular vertex will have the same normal,
                                                       color, and texture coordinates, like this - instead of like this.
      void Draw();
                                                       Draw the primitive. If this is the first time Draw() is being called, it will
                                                       setup all the proper buffer objects, etc. If it is a subsequent call, then it
                                                       will just initiate the drawing.
                                                       Same as Draw(), but will draw multiple instances. Must be using
      void DrawInstanced( numInstances );
                                                       shaders to make this worthwhile.
      void glBegin( topology);
                                                      Begin the definition of a primitive.
      void glColor3f( r, g, b);
                                                      Specify a vertex's color.
      void glColor3fv( rgb[ 3 ] );
  Ore Ur void glEnd();
                                                      Terminate the definition of a primitive.
Compi
```

Vertex Buffer Object Class Methods

Specify a vertex's normal.

void glTexCoord2f(s, t); Specify a vertex's texture coordinates.

void glTexCoord2fv(st[2]);

void glVertex3f(x, y, z);
void glVertex3fv(xyz[3]);
Specify a vertex's coordinates.

void Print(char *text, FILE *); Prints the vertex, normal, color, texture coordinate, and connection element information to a file, along with some preliminary text. If the file pointer is not given, standard error (i.e., the console) is used.

Causes the primitive to be restarted. This is useful when doing triangle strips or quad strips and you want to start another one without getting out of the current one. By doing it this way, all of the strips' vertices will end up in the

same table, and you only need to have one VertexBufferObject class going.

void glNormal3f(nx, ny, nz);

void glNormal3fv(nxyz[3]);

27

27

Notes

• If you want to print the contents of your data structure to a file (for debugging or curiosity), do this:

• You can call the *glBegin* method more than once. Each call will wipe out your original display information and start over from scratch. This is useful if you are interactively editing geometry, such as sculpting a curve.

mib - August 30 2024

A Caveat

Be judicious about collapsing common vertices! The good news is that it saves space and it might increase speed some (by having to transform fewer vertices). But, the bad news is that it takes much longer to create large meshes. Here's why.

Say you have a 1,000 x 1,000 point triangle mesh, drawn as 999 triangle strips, all in the same VertexBufferObject class (which you can do using the RestartPrimitive method).

When you draw the S^{th} triangle strip, half of those points are coincident with points in the $S-1^{st}$ strip. But, to find those 1,000 coincident points, it must search through 1000*S points first. There is no way to tell it to only look at the last 1,000 points. Even though the search is only $O(log_2N)$, where N is the number of points kept so far, it still adds up to a lot of time over the course of the entire mesh.

It starts out fast, but slows down as the number of points being held increases.

If you did have a 1,000 x 1,000 mesh, it might be better to not collapse vertices at all. Or, a compromise might be to collapse vertices, but break this mesh up into 50 *VertexBufferObjects*, each of size 20 x 1,000.

Just a thought...

mjb - August 30, 2024

Using Vertex Buffers with Shaders

32

Let's say that we have the following **vertex shader** and we want to supply the vertices from a Vertex Buffer Object.

```
in vec3 aVertex;
in vec3 aColor;

out vec3 vColor;

void
main()
{
         vColor = aColor;
         gl_Position = gl_ModelViewProjectionMatrix * vec4( aVertex, 1. );
}
```

Oregon State
University
Computer Graphics

Let's also say that, at some time, we want to supply the colors from a Vertex Buffer Object as well, but for right now, the color will be uniform.

nib – August 30, 2024

Using Vertex Buffers with Shaders

We're assuming here that

- we already have the shader program setup in program
- we already have the vertices in the vertexBuffer

```
glBindBuffer( GL_ARRAY_BUFFER, vertexBuffer );
glEnableClientState( GL_VERTEX_ARRAY );
glEnableClientState( GL_COLOR_ARRAY );
GLuint vertexLocation = glGetAttribLocation( program, "aVertex" );
GLuint colorLocation = glGetAttribLocation( program, "aColor" );
glVertexAttribPointer( vertexLocation, 3, GL_FLOAT, GL_FALSE, 0, (GLuchar *)0 );
glEnableVertexAttribArray( vertexLocation ); // dynamic attribute
glVertexAttrib3f( colorLocation, r, g, b ); // static attribute
glVertexAttribArray( colorLocation );
glDrawArrays( GL_TRIANGLES, 0, 3*numTris );
```

mjb - August 30, 2024

33

Using Vertex Buffers with the Shaders C++ Class

34

We're assuming here that

- we already have the vertices in the *vertexBuffer*
- we have already created a C++ GLSLProgram class object called Pattern

```
glBindBuffer( GL_ARRAY_BUFFER, vertexBuffer );
glEnableClientState( GL_VERTEX_ARRAY );
glEnableClientState( GL_COLOR_ARRAY );
Pattern.SetVertexAttributePointer3fv( "aVertex", (GLfloat *)0 );
Pattern.EnableVertexAttribArray( "aVertex" ); // dynamic attribute

Pattern.SetVertexAttributeVariable( "aColor", r, g, b ); // static attribute
Pattern.EnableVertexAttribArray( "aColor" );
glDrawArrays( GL_TRIANGLES, 0, 3*numTris );
```
