Who is the Real Vulkan?

Do you notice the difference? It’s subtle! 😊

Who is the Khronos Group?

The Khronos Group, Inc. is a non-profit member-funded industry consortium, focused on the creation of open standard, royalty-free application programming interfaces (APIs) for authoring and accelerated playback of dynamic media on a wide variety of platforms and devices. Khronos members may contribute to the development of Khronos API specifications, vote at various stages before public deployment, and accelerate delivery of their platforms and applications through early access to specification drafts and conformance tests.

Who’s Been Specifically Working on Vulkan?

Vulkan

- Largely derived from AMD’s Mantle API
- Also heavily influenced by Apple’s Metal API and Microsoft’s DirectX 12
- There is no fixed-function – it is all shaders-based
- Fortunately, the shader language Vulkan uses is GLSL
- Goal: much less driver complexity and overhead than OpenGL has
- Goal: much less user hand-holding
- Goal: higher single-threaded performance than OpenGL can deliver
- Goal: able to do multithreaded graphics
- Goal: able to run on desktops and mobile devices

Playing ‘Where’s Waldo’ with Khronos Membership

Vulkan
Vulkan Code has a Distinct "Style" of Setting Information in structs and then Passing that Information as a pointer-to-the-struct:

```cpp
VkBufferCreateInfo vbci;
vbci.sType = VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO;
vbci.pNext = nullptr;
vbci.flags = 0;
vbci.size = buffer size in bytes; // Fill this out
vbci.usage = VK_USAGE_UNIFORM_BUFFER_BIT;
vbci.sharingMode = VK_SHARING_MODE_EXCLUSIVE;
vbci.queueFamilyIndexCount = 0;
vbci.pQueueFamilyIndices = nullptr;

VK_RESULT result = vkCreateBuffer(LogicalDevice, IN &vbci, PALLOCATOR, OUT &Buffer);
```

Vulkan Command Buffers:
- Graphics commands are sent to command buffers
- Think OpenCL...
- E.g., `vkCmdDoSomething(cmdBuffer, ...);

You can have as many simultaneous Command Buffers as you want
- Buffers are flushed when the application wants them flushed
- Each command buffer can be filled from a different thread (i.e., filling is thread-safe)

Vulkan Graphics Pipelines:
- In OpenGL, your graphics "pipeline state" is whatever combination you most recently set: color, transformations, features, shaders, etc.
- In OpenGL, changing the state is very expensive
- Vulkan forces you to set all your state at once into a "pipeline state object" (PSO) and then invoke the entire PSO whenever you want to use that state combination
- Think of pipeline state as being immutable.
- Potentially, you could have thousands of these pre-prepared states – if there are N things to set, there could be N! possible combinations.
- This is a good time to talk about how game companies view Vulkan...

Vulkan GPU Memory
- Your application allocates GPU memory for the objects it needs
- Your application is responsible for making sure what you put into that memory is actually in the right format, is the right size, etc.

Vulkan Synchronization
- Events can be set, polled, and waited for (much like OpenCL)
- Vulkan does not ever synchronize – that's the application's (i.e., your) job
Vulkan Shaders

GLSL is the same as before... well, almost – here’s what’s different:

- An implied
  
  ```
  #define VULKAN 100
  ```

  is automatically supplied by the compiler

- You pre-compile your shaders with an external compiler called glslang

- Your shaders get turned into a vendor-independent intermediate form known as SPIR-V

- SPIR-V gets turned into fully-compiled, vendor-specific code at runtime

- The SPIR-V spec has been public for years – new shader languages could be developed

- OpenCL and OpenGL have adopted SPIR-V as well

---

![Diagram of the compilation process](image1)

Advantages:

1. Software vendors don't need to ship their shader source
2. Software can launch faster because half of the compilation has already taken place
3. This guarantees a common front-end syntax
4. This allows for other language front-ends

---

SPIR-V stands for Standard Portable Intermediate Representation – Vulkan. It's the file format that Vulkan GLSL shaders get compiled into. The name of that front-end compiler is glslang. At runtime, that file is read and the driver compiles it the rest of the way into the machine instruction set for that particular vendor.

SPIR-V started out as something for Vulkan but is now also used with OpenGL and OpenCL. Here is how it fits into the overall Khronos Ecosystem:

---

Ray-tracing Acceleration is Appearing in Graphics Hardware and it has been Added to the Vulkan API

---

The Vulkan Ray Tracing Pipeline Involves Five New Shader Types

- A **Ray Generation Shader (rgen)** runs on a 2D grid of threads. It begins the entire ray-tracing operation.

- An **Intersection Shader (rint)** is called whenever a ray hits an object. It checks if the hit is valid and if it needs further analysis.

- An **Any Hit Shader (rahit)** is called when the Intersection Shader finds a hit. It decides if that hit should be accepted or rejected.

- A **Closest Hit Shader (rchit)** is called with the information about the hit that happened closest to the viewer. Typically, lighting is done here, or firing off new rays to handle shadows, reflections, and refractions.

- A **Miss Shader (rmiss)** is called when no intersections are found for a given ray. Typically, it just sets the pixel color to the background color.

---

Ray-Tracing Acceleration Structures

- A Bottom-level Acceleration Structure (BLAS) reads the vertex data from vertex (and possibly index) VkBuffers to determine Axis-Aligned Bounding Boxes (AABBs).

- You can also supply your own AABB information to a BLAS.

- A single Top-level Acceleration Structure (TLAS) holds Instances, which are transformations and pointers to (potentially) multiple BLASes.

- Each BLAS is essentially used as a Model Coordinate bounding box, while the single TLAS is used as a World Coordinate bounding box.
So What Do We All Do Now?

- I don't see Vulkan replacing OpenGL ever.
- I see the OSU CS 450/550 class using OpenGL existing forever.
- I see the OSU Vulkan course as always being a one-term standalone course, not part of another OpenGL-based course.

This is what I think the model of the immediate future is:

- You (definitely)!
- You (definitely)!
- You (if you need max performance)
- You (if you need ray tracing)
- Game Engine or 3rd Party Application
