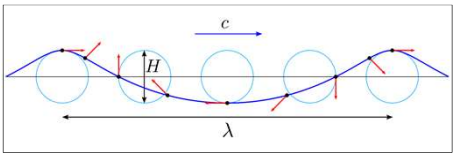
How Do Waves Work?

First of all, the water in waves doesn't "flow". It moves in a circular pattern. The equation for this is called a Trochoidal wave, or a Gerstner wave, named after mathematician Franz Josef Gerstner who discovered this in 1802.

Click on the Wikipedia link below for more information. It's an interesting read.



https://en.wikipedia.org/wiki/Trochoidal_wave

If you scroll down in the Wikipedia article, you will see a section called **In Computer Graphics**. I adapted the following equations and code from that section. I am assuming deep water so that the hyperbolic tangent term drops out. Feel free to put it back. I also changed the wave density components to an angular direction (γ) instead.

Gerstner Wave Equations

$$x' = x - \sum_{m=0}^{M-1} A_m cos\gamma_m sin\theta_m$$

$$y' = \sum_{m=0}^{M-1} A_m cos\theta_m$$

$$z' = z - \sum_{m=0}^{M-1} A_m sin\gamma_m sin\theta_m$$

(x, y, z) = *original vertex coordinates*

(x', y', z') = *displaced vertex coordinates*

$$\theta_m = k_m cos\gamma_m x + k_m sin\gamma_m y - \omega_m t - \emptyset_m$$

$A_m = Amplitude$

$\omega_m = \sqrt{g k_m}$

$\gamma_m = Wave\ propagation\ angle$

$t = time$

$k_m = Wave\ density$

$\emptyset_m = Wave\ phase\ shift$
