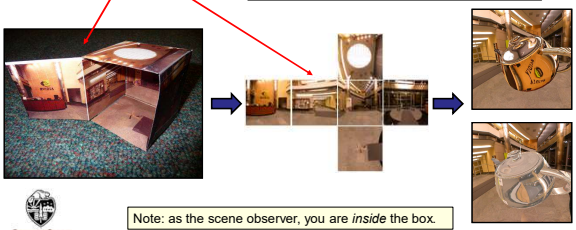
What is Cube Mapping?

Cube Mapping is the process of creating a representation of an object's surrounding environment as a collection of 6 images, grouped together as a single "cube map texture".

Think of it as a folding box.(BTW, I have this box on a 2-sided PowerPoint slide if you want to print and cutout your own.)

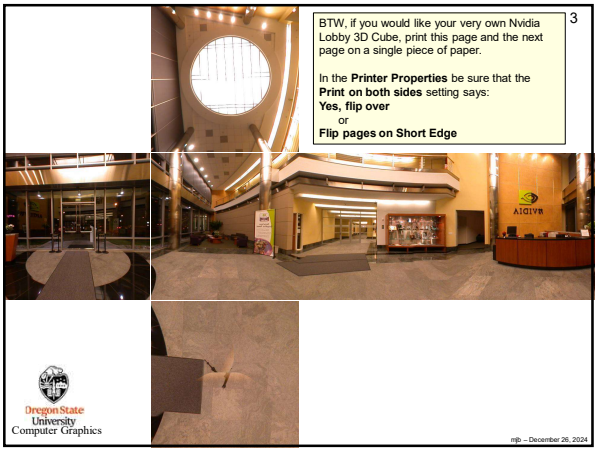
BTW, I have this box on a 2-sided PowerPoint if you want to print and cutout your own. Let me know.



Note: as the scene observer, you are *inside* the box.

Oregon State University Computer Graphics

3



BTW, if you would like your very own Nvidia Lobby 3D Cube, print this page and the next page on a single piece of paper.

In the **Printer Properties** be sure that the **Print on both sides** setting says:
Yes, flip over
or
Flip pages on Short Edge

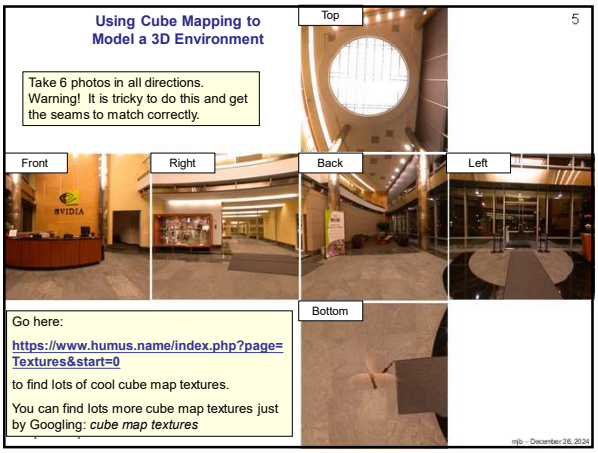
5

Using Cube Mapping to Model a 3D Environment

Take 6 photos in all directions. Warning! It is tricky to do this and get the seams to match correctly.



Go here:

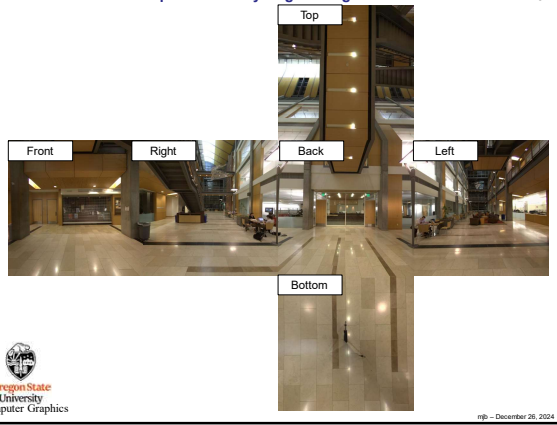
https://www.humus.name/index.php?page=Textures&start=0

to find lots of cool cube map textures.

You can find lots more cube map textures just by Googling: *cube map textures*

6

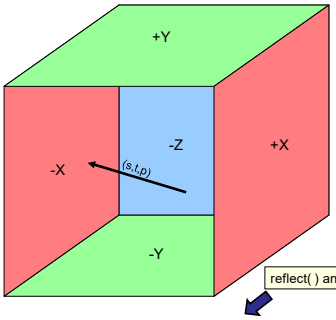
Cube Map of the Kelley Engineering Center Atrium



Oregon State University Computer Graphics

Cube Map Texture Lookup:
Given an (s,t,p) direction vector , what (r,g,b) does that correspond to?

7



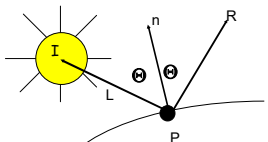
- Let L be the texture coordinate of (s, t, and p) with the largest *magnitude*
- L determines which of the 6 2D texture "walls" is being hit by the vector (-X in this case)
- The texture coordinates in that texture are the remaining two texture coordinates divided by L: (s=a/L,t=b/L)

reflect( ) and refract( ) are built-in GLSL functions

```
vec3 ReflectVector = reflect( vec3 eyeDir, vec3 normal );
vec3 RefractVector = refract( vec3 eyeDir, vec3 normal, float Eta );
```

Remember Angle-of-Reflection-Equals-Angle-of-Incidence from Lighting?

8



That's what the built-in reflect( ) function does.

Using the Cube Map for Reflection

9

Using the Cube Map for Reflection

10

Vertex shader

```
out vec3  vNormal;
out vec3  vEyeDir;
out vec3  vMC;

void
main( )
{
	vec4 newVertex = gl_Vertex;
		// could possibly apply displacements to newVertex here
	vMC = newVertex.xyz;
	vec3 ECposition = ( gl_ModelViewMatrix * newVertex).xyz;
	vEyeDir = ECposition – vec3(0.,0.,0.);		// vector from eye to pt
	vNormal = normalize( gl_NormalMatrix * gl_Normal );
					// or newNormal if you have displaced vertices
	gl_Position = gl_ModelViewProjectionMatrix * newVertex;
}
```

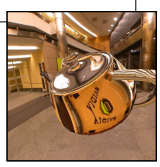
Using the Cube Map for Reflection

11

Fragment shader

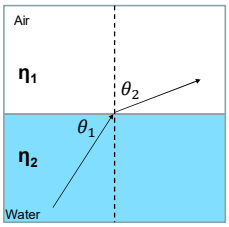
```
in vec3  vNormal;
in vec3  vEyeDir;
in vec3  vMC;
uniform samplerCube  uReflectUnit;

void
main( )
{
	vec3 normal = vNormal;
		// if you are bump-mapping, apply noise to normal here using vMC
	vec3 reflectVector = reflect( vEyeDir, normal );
	vec4 reflectColor = texture( uReflectUnit, reflectVector );   // on Macs, use textureCube( )
	gl_FragColor = vec4( reflectColor.rgb, 1. );
}
```



The Index of Refraction, η (eta)

12



The Index of Refraction (IOR) is a measure of how much light slows down as it passes through a particular material. The larger the IOR, the slower the speed of light in that material.

Snell's Law of Refraction says that:

$$\frac{sin\theta_2}{sin\theta_1} = \frac{\eta_1}{\eta_2}$$

Or:

$$sin\theta_2 = sin\theta_1 \frac{\eta_1}{\eta_2}$$

That's what the built-in refract( ) function does.

Notice that there are certain combinations of the η's that require $\sin\Theta_2$ to be outside the range -1. → +1., which is not possible. This indicates that the refraction has actually become a **Total Internal Reflection**.

https://en.wikipedia.org/wiki/Snell's_law

Common Indices of Refraction

13

Material	η
Air	1.000237
Ice	1.31
Water	1.33
Pyrex	1.47
Window Glass	1.52
Quartz	1.54
Cubic Zirconia	2.16
Diamond	2.42
Moissanite	2.69

Using the Cube Map for Refraction

14

Using the Cube Map for Refraction

15

Vertex shader

```
out vec3  vNormal;
out vec3  vEyeDir;
out vec3  vMC;

void
main( )
{
	vec4 newVertex = gl_Vertex;
		// could possibly apply displacements to newVertex here
	vMC = newVertex.xyz;
	vec3 ECposition = ( gl_ModelViewMatrix * newVertex).xyz;
	vEyeDir = ECposition – vec3(0.,0.,0.);		// vector from eye to pt
	vNormal = normalize( gl_NormalMatrix * gl_Normal );
					// or newNormal if you have displaced vertices
	gl_Position = gl_ModelViewProjectionMatrix * newVertex;
}
```

Same as for reflection…

Using the Cube Map for Refraction

16

Fragment shader

```
in vec3  vNormal;
in vec3  vEyeDir;
in vec3  vMC;

uniform float  uEta;
uniform samplerCube  uReflectUnit;
uniform samplerCube  uRefractUnit;
uniform float  uMix, uWhiteMix;

const vec3 WHITE = vec3( 1.,1.,1. );

void main()
{
	vec3 normal = vNormal;
					// if you are bump-mapping, apply noise to normal here using vMC
	vec3 reflectVector = reflect( vEyeDir, normal );
	vec3 reflectColor = texture( uReflectUnit, reflectVector ).rgb;		// on Macs, use textureCube()

	vec3 refractVector = refract( vEyeDir, normal, uEta );
	vec3 refractColor;
	if( all( equal( refractVector, vec3(0.,0.,0.) ) ) )		// like saying "if all elements of the refractVector are == 0.0 ..."
	{
		refractColor = reflectColor;		// . . . then treat this as a total internal reflection
	}
	else
	{
		refractColor = texture( uRefractUnit, refractVector ).rgb;		// on Macs, use textureCube()
		refractColor = mix( refractColor, WHITE, uWhiteMix );
	}
	vec3 color = mix( refractColor, reflectColor, uMix );
	color = mix( color, WHITE, uWhiteMix );
	gl_FragColor = vec4(color, 1. );
}
```

Teapot
```

These have nothing to do with the cube mapping. They are here to create the six walls, without which the cube mapping looks ridiculous.

These must be listed in the order:
+X, -X, +Y, -Y, +Z, -Z
