Using Vertex Shaders for Hyperbolic Geometry

Zooming and Panning Around a Complex 2D Display

- Standard (Euclidean) geometry zooming forces much of the information off the screen
- This eliminates the context from the zoomed-in display
- This problem can be solved with *hyperbolic methods* if we are willing to give up Euclidean geometry
- At one time, this would have also meant severely giving up graphics performance, but not now (thanks to shaders)

Polar Hyperbolic Equations

Overall theme: something divided by something a little bigger

$\lim_{K \to 0} R' = 1$

$\lim_{K \to \infty} R' = 0$

(X,Y)

R → R' = R / (R+K)

Θ → Θ' = Θ

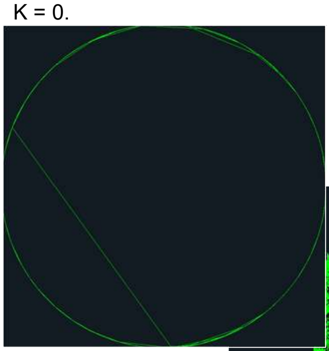
X' = R'cosΘ'
Y' = R'sinΘ'

The Effect of K

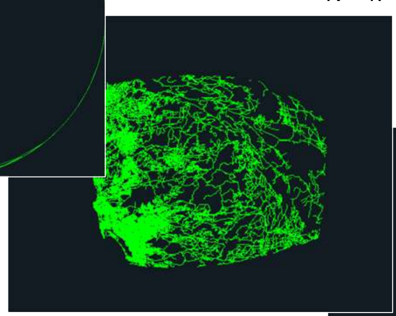
$\lim_{K \to 0} R' = 1$

$\lim_{K \to \infty} R' = 0$

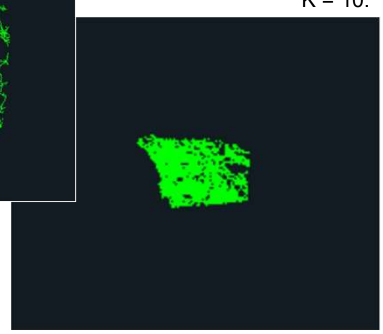
K = 0.



K = 1.



K = 10.



7

Polar Hyperbolic Equations

$$R = \sqrt{X^2 + Y^2}$$

$$\Theta = \tan^{-1}(\frac{Y}{X})$$

But fortunately, we don't actually need to ever call the atan( ) function because there are shortcuts to get what we need:

$$\cos\Theta = \frac{X}{R}$$

$$\sin\Theta = \frac{Y}{R}$$

$$R' = \frac{R}{R + K}$$

Coordinates moved to the outer edge when K = 0

Coordinates moved to the center when K = ∞

$$X' = R'\cos\Theta = \frac{R}{R+K} \times \frac{X}{R} = \frac{X}{R+K}$$

$$Y' = R'\sin\Theta = \frac{R}{R+K} \times \frac{Y}{R} = \frac{Y}{R+K}$$

Cartesian Hyperbolic Equations

Polar

$$X' = \frac{X}{R + K}$$

$$Y' = \frac{Y}{R + K}$$

Coordinates moved to the outer edge when K = 0

Coordinates moved to the center when K = ∞

Cartesian

$$X' = \frac{X}{\sqrt{X^2 + K^2}}$$

$$Y' = \frac{Y}{\sqrt{Y^2 + K^2}}$$

Coordinates moved to the outer edge when K = 0

Coordinates moved to the center when K = ∞
