## Identify the Light Source Casting the Shadow

mjb - December 31, 2020

### First, Render the Scene from that Light Source

3

1. Render a view from the light source – everything you cannot see must be in a shadow

mjb - December 31, 2020

3

### Use the Z-buffer as a Depth Shadow Map

4

2. Generate a depth view from the light source

mjb - December 31, 2020

4

## Second, Render the Scene as Normal, but Consult the Depth Map to Decide where Lighting Applies

5

3. Put the eye back where it really belongs. Render that view. Every time you create a pixel in the scene, compare its 3D location against the depth map. If the light-position camera could not see it before, don't allow lighting to be applied to it now.

5

## OpenGL Demo Program: The Depth Shadow Map

6

The depth shadow map is created from the point of view of the light source.

The rendering is done into a texture and only renders the depth, not any colors. (Normally, we would render both, but in this case, we only care about the depth.)

In this grayscale depth image, dark colors are nearest to the eye, light colors are farther away.

6

## OpenGL Demo Program: Creating the Off-screen Depth Shadow Map Framebuffer

7

```
// create a framebuffer object and a depth texture object:
glGenFramebuffers(1, &DepthFramebuffer );
glGenTextures( 1, &DepthTexture );

//Create a texture that will be the framebuffer's depth buffer
glBindTexture(GL_TEXTURE_2D, DepthTexture );
glTexImage2D(GL_TEXTURE_2D, 0, GL_DEPTH_COMPONENT, SHADOW_WIDTH, SHADOW_HEIGHT,
0, GL_DEPTH_COMPONENT, GL_FLOAT, NULL);
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER, GL_NEAREST);
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MAG_FILTER, GL_NEAREST);
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_S, GL_CLAMP_TO_EDGE);
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_T, GL_CLAMP_TO_EDGE);

// attach texture to the current framebuffer as a depth buffer:
glBindFramebuffer(GL_FRAMEBUFFER, DepthFramebuffer);
glFramebufferTexture2D(GL_FRAMEBUFFER, GL_DEPTH_ATTACHMENT, GL_TEXTURE_2D, DepthTexture, 0);

// force opengl to accept a framebuffer that doesn't have a color buffer in it:
glDrawBuffer(GL_NONE);
glReadBuffer(GL_NONE);
```

glm::mat4 lightView = glm::lookAt( lightPos, glm::vec3(0., 0., 0.), glm::vec3(0., 1., 0.) );

//this matrix is the transformation matrix that the vertex shader will use instead of glm::mat4 lightView:
glm::mat4 lightSpaceMatrix = lightProjection * lightView;

glViewport(0, 0, SHADOW_WIDTH, SHADOW_HEIGHT);
