Why Two URLs?

<http://mpi-forum.org>
 This is the definitive reference for the MPI standard. Go here if you want to read the official specification, which, BTW, continues to evolve.

<https://www.open-mpi.org/>
 This consortium formed later. This is the open source version of MPI. If you want to start using MPI, I recommend you look here. This is the MPI that the COE systems use.

<https://www.open-mpi.org/doc/v4.0/>
 This URL is also really good – it is a link to all of the MPI man pages.

3

MPI: The Basic Idea

Programs on different CPUs coordinate computations by passing messages between each other.

Note: Each CPU in the MPI "cluster" must be prepared ahead of time by having the MPI server code installed on it. It must then have that server code running and listening on its socket connection. Each MPI CPU must also have an integer ID assigned to it (called its *rank*).

mpb - May 22, 2024

4

This paradigm is how modern supercomputers work!

The Texas Advanced Computing Center's *Frontiera* supercomputer

mpb - May 22, 2024

5

How to SSH to the COE MPI Cluster

ssh over to an MPI submission machine -- **submit-a** and **submit-b** will also work

```
flip3 151% ssh submit-c.hpc.engr.oregonstate.edu
```

submit-c 142% module load slurm
submit-c 143% module load openmpi

Type these right away to set your path correctly

BTW, you can find out more about the COE cluster here:
<https://it.engineering.oregonstate.edu/hpc>

"The College of Engineering HPC cluster is a heterogeneous mix of about 130 servers providing nearly 4000 CPU cores, over 200 GPUs, and over 43 TB total RAM. The systems are connected via gigabit ethernet and Infiniband. Most of the latest servers utilize Mellanox EDR or HDR InfiniBand network connection. The cluster also has access to 150TB global scratch from the College of Engineering's Dell/EMC Isilon enterprise storage. The CoE HPC Cluster is rated at over 1700 peak TFLOPS (double-precision)."

mpb - May 22, 2024

6

Compiling and Running

```
mpicc -o program program.c . . .
```

← C

or

```
mpic++ -o program program.cpp . . .
```

← C++

```
mpirun -mca btl self,tcp -np 4 program
```

← All distributed processors execute the same program at the same time

of processors to use

Warning – use *mpic++* and *mpirun*.

Don't use g++.

Don't run by just typing the name of the executable!

Oregon State University Computer Graphics

7

Running with a bash Batch Script

```
submit.bash:
#!/bin/bash
#SBATCH -J AutoCorr
#SBATCH -A cs475-575
#SBATCH -p classmpitest
#SBATCH -N 8 # number of nodes
#SBATCH -n 8 # number of tasks
#SBATCH -o mpiproject.out
#SBATCH -e mpiproject.err
#SBATCH --mail-type=END,FAIL
#SBATCH --mail-user=joeparallel@oregonstate.edu
module load openmpi
mpic++ mpiproject.cpp -o mpiproject -lm
mpirun -mca btl self,tcp -np 4 ./mpiproject
```

← Your Job Name

← This is the partition name that we use for our class when debugging and testing your program. Use *classmpifinal* for taking your final performance numbers.

← These 3 lines are bash code

```
submit-c 143% sbatch submit.bash
Submitted batch job 258759
```

Oregon State University Computer Graphics

8

What is the Difference Between the Partitions *classmpitest* and *classmpifinal*?

classmpitest lets your program get into the system sooner, but it might be running alongside other jobs, so its performance might suffer. But, you don't care because you are just compiling and debugging, not taking performance numbers for your report.

classmpifinal makes your program wait in line until it can get dedicated resources so that you get performance results that are much more representative of what the machines can do, and thus are worthy to be listed in your report.

Oregon State University Computer Graphics

9

Auto-Notifications via Email

```
#SBATCH --mail-user=joeparallel@oregonstate.edu
```

You don't have to ask the system to email information to you, but if you do, *please be sure you get your own email address right!*

Our IT people are getting *really* tired of fielding the bounced emails when people misspell their own email address.

Oregon State University Computer Graphics

10

Use slurm's *scancel* if your Job Needs to Be Killed

```
submit-c 143% sbatch submit.bash
Submitted batch job 258759
```

```
submit-c 144% scancel 258759
```

Oregon State University Computer Graphics

11

Setting Up and Finishing MPI

```
#include <mpi.h>

int
main( int argc, char *argv[ ] )
{
. . .
    MPI_Init( &argc, &argv );
. . .

    MPI_Finalize();
    return 0;
}
```

You don't need to process command line arguments if you don't want to. You can just call `MPI_Init()` as:

```
MPI_Init( NULL, NULL );
```

Oregon State University Computer Graphics

12

MPI Follows a Single-Program-Multiple-Data (SPMD) Model

A **communicator** is a collection of CPUs that are capable of sending messages to each other

This requires MPI server code getting installed on all those CPUs. That code then needs to be running and listening on a socket connection. Only an administrator can do this.

Getting information about our place in the **communicator**:

```
int numCPUs; // total # of cpus involved
int me; // which one I am

MPI_Comm_size( MPI_COMM_WORLD, &numCPUs );
MPI_Comm_rank( MPI_COMM_WORLD, &me );
```

Size, i.e., how many altogether?

Rank, i.e., which one am I?

It is then each CPU's job to figure out what piece of the overall problem it is responsible for and then go do it.

Oregon State University Computer Graphics

13

A First Test of MPI

```
#include <stdio.h>
#include <math.h>
#include <mpi.h>

#define THEBOSS 0

int
main( int argc, char *argv[] )
{
    MPI_Init( &argc, &argv );

    int numCPUs; // total # of cpus involved
    int me; // which one I am

    MPI_Comm_size( MPI_COMM_WORLD, &numCPUs );
    MPI_Comm_rank( MPI_COMM_WORLD, &me );

    if( me == THEBOSS )
        fprintf( stderr, "Rank %d says that we have a Communicator of size %d\n", THEBOSS, numCPUs );
    else
        fprintf( stderr, "Welcome from Rank %d\n", me );

    MPI_Finalize( );
    return 0;
}
```

14

```
submit-c 165% mplexec -np 16 ./first
Welcome from Rank 13
Welcome from Rank 15

15

So, we have a group (a "communicator") of distributed processors. How do they communicate about what work they are supposed to do?

Example: You could coordinate the units of our DGX system using MPI

Oregon State University Computer Graphics

16

A Good Place to Start: MPI Broadcasting

```
MPI_Bcast( array, count, type, src, MPI_COMM_WORLD );
```

Address of the data to send from if you are the src node; **# elements**

Address of the data to receive into if you are not

MPI_CHAR
MPI_INT
MPI_LONG
MPI_FLOAT
MPI_DOUBLE
...

rank of the CPU doing the sending

Broadcast

Both the sender and receivers need to execute **MPI_Bcast** - there is no separate receive function

Oregon State University Computer Graphics

17

MPI Broadcast Example

This is our heat transfer equation from before. Clearly, every CPU will need to know this value.

$$\Delta T_i = \left(\frac{k}{\rho C} \right) \left(\frac{T_{i-1} - 2T_i + T_{i+1}}{(\Delta x)^2} \right) \Delta t$$

```
int numCPUs;
int me;
float k_over_rho_c; // the THEBOSS node will know this value, the others won't (yet)

#define THEBOSS 0

MPI_Comm_size( MPI_COMM_WORLD, &numCPUs ); // how many are in this communicator
MPI_Comm_rank( MPI_COMM_WORLD, &me ); // which one am I?

if( me == THEBOSS )
{
    << read k_over_rho_c from the data file >>
    MPI_Bcast( &k_over_rho_c, 1, MPI_FLOAT, THEBOSS, MPI_COMM_WORLD ); // send if I am THEBOSS, and receive if not
}
```

I am the THEBOSS: this identifies this call as a send

Broadcast

Oregon State University Computer Graphics

18

How Does this Work? Think Star Trek Wormholes!

19

Oregon State University
Computer Graphics

19

Sending Data from One Source CPU to Just One Destination CPU

```
MPI_Send( array, numToSend, type, dst, tag, MPI_COMM_WORLD );
```

address of data to send from

elements (note: this is the number of elements, not the number of bytes!)

MPI_CHAR
MPI_INT
MPI_LONG
MPI_FLOAT
MPI_DOUBLE
...

rank of the CPU to send to

An integer or character to differentiate this transmission from any other transmission. I like to use chars.

Rules:

- One message from a specific *src* to a specific *dst* cannot overtake a previous message from the same *src* to the same *dst*.
- `MPI_Send()` blocks until the transfer is far enough along that *array* can be destroyed or re-used.
- There are no guarantees on order from different *src*'s.

src node  dst node

20

Oregon State University
Computer Graphics

20

Receiving Data in a Destination CPU from a Source CPU

```
MPI_Recv( array, maxCanReceive, type, src, tag, MPI_COMM_WORLD, &status );
```

address of data to receive into

elements we can receive, at most

MPI_CHAR
MPI_INT
MPI_LONG
MPI_FLOAT
MPI_DOUBLE
...

Rank of the CPU we are expecting to get a transmission from

Type = MPI_Status

An integer or character to differentiate what transmission we are looking for with this call (be sure this matches what the sender is sending!). I like to use chars.

Rules:

- The receiver blocks waiting for data that matches what it declares to be looking for
- One message from a specific *src* to a specific *dst* cannot overtake a previous message from the same *src* to the same *dst*
- There are no guarantees on the order from different *src*'s
- The order from different *src*'s could be implied in the *tag*
- *status* is type `MPI_Status` – the “&status” can be replaced with `MPI_STATUS_IGNORE`

src node  dst node

21

Oregon State University
Computer Graphics

21

Example

Remember, this *identical* code runs on all CPUs:

```
int numCPUs;
int me;
#define MYDATA_SIZE 128
char myData[ MYDATA_SIZE ];
#define THEBOSS 0

MPI_Comm_size( MPI_COMM_WORLD, &numCPUs );
MPI_Comm_rank( MPI_COMM_WORLD, &me );

if( me == THEBOSS ) // the primary
{
    for( int dst = 0; dst < numCPUs; dst++ )
    {
        if( dst != THEBOSS )
        {
            char *InputData = "Hello, Beavers!";
            MPI_Send( InputData, strlen(InputData)+1, MPI_CHAR, dst, 'B', MPI_COMM_WORLD );
        }
    }
}
else // a secondary
{
    MPI_Recv( myData, MYDATA_SIZE, MPI_CHAR, THEBOSS, 'B', MPI_COMM_WORLD, MPI_STATUS_IGNORE );
    printf( " %s' from rank # %d\n", in, me );
}
}

// You are highly discouraged from sending to yourself. Because both the send and receive are capable of blocking, the result could be deadlock.
```

22

Oregon State University
Computer Graphics

22

How does MPI let the Sender perform an MPI_Send() even if the Receivers are not ready to MPI_Recv()?

Sender

MPI_Send()

MPI Transmission Buffer

Receiver

MPI_Recv()

MPI Transmission Buffer

MPI_Send() blocks until the transfer is far enough along that the *array* can be destroyed or re-used.

23

Oregon State University
Computer Graphics

23

Another Example

You typically don't send the entire workload to each *dst* – you just send part of it, like this:

```
#define NUMELEMENTS ?????
int numCPUs;
int me;
#define THEBOSS 0

MPI_Comm_size( MPI_COMM_WORLD, &numCPUs );
MPI_Comm_rank( MPI_COMM_WORLD, &me );

int PPSize = NUMELEMENTS / numCPUs; // per-processor data size -- assuming it comes out evenly
float *myData = new float [ PPSize ];

if( me == THEBOSS ) // the sender
{
    float *InputData = new float [ NUMELEMENTS ];
    << read the full input data into InputData from disk >>
    for( int dst = 0; dst < numCPUs; dst++ )
    {
        if( dst != THEBOSS )
        {
            MPI_Send( &InputData[dst*PPSize], PPSize, MPI_FLOAT, dst, 0, MPI_COMM_WORLD );
        }
    }
}
else // a receiver
{
    MPI_Recv( myData, PPSize, MPI_FLOAT, THEBOSS, 0, MPI_COMM_WORLD, MPI_STATUS_IGNORE );
    // do something with this subset of the data
}
}
```

24

Oregon State University
Computer Graphics

24

In Distributed Computing, You Often Hear About These Design Patterns 25

Broadcast
This sends the same data to each processor

Scatter
This sends pieces of the data to each processor

Gather
This brings back pieces of the results from each processor

Oregon State University
Computer Graphics

#B - May 22, 2024

25

Scatter and Gather Usually Go Together 26

This sends pieces of the data to each processor

Scatter

This brings back pieces of the results from each processor

Gather

Note surprisingly, this is referred to by the combined term **Scatter/Gather**

Oregon State University
Computer Graphics

#B - May 22, 2024

26

MPI Scatter 27

Take a data array, break it into equal portions, and send it to each CPU

```
MPI_Scatter( snd_array, snd_count, snd_type, rcv_array, rcv_count, rcv_type, src, MPI_COMM_WORLD );
```

The total large array to split up
elements to send per-processor

MPI_CHAR
MPI_INT
MPI_LONG
MPI_FLOAT
MPI_DOUBLE
...

Local array to store this processor's piece in
elements to receive per-processor

MPI_CHAR
MPI_INT
MPI_LONG
MPI_FLOAT
MPI_DOUBLE
...

This is who is doing the sending - everyone else is receiving

Scatter

Both the sender and receivers need to execute **MPI_Scatter**. There is no separate receive function

Oregon State University
Computer Graphics

#B - May 22, 2024

27

MPI Gather 28

```
MPI_Gather( snd_array, snd_count, snd_type, rcv_array, rcv_count, rcv_type, dst, MPI_COMM_WORLD );
```

The total large array to put the pieces back into
elements to return per-processor

MPI_CHAR
MPI_INT
MPI_LONG
MPI_FLOAT
MPI_DOUBLE
...

Local array that this processor is sending back
elements to send back per-processor

MPI_CHAR
MPI_INT
MPI_LONG
MPI_FLOAT
MPI_DOUBLE
...

This is who is doing the receiving - everyone else is sending

Gather

Both the sender and receivers need to execute **MPI_Gather**. There is no separate transmit function

Oregon State University
Computer Graphics

#B - May 22, 2024

28

Remember This? It's Baaaaack as a complete Scatter/Gather Example 29

CPU #0 | CPU #1 | CPU #2 | CPU #3

The **Compute : Communicate Ratio** still applies, except that it is even more important now because there is much more overhead in the Communicate portion.

This pattern of breaking a big problem up into pieces, sending them to different CPUs, computing on the pieces, and getting the results back is very common. That's why MPI has its own scatter and gather functions.

double MPI_Wtick( );
```

Returns the resolution of the clock, in seconds.

```
double MPI_Wtime( );
```

Returns the time, in seconds, since "some time in the past".

Warning: the clocks on the different CPUs are not guaranteed to be synchronized!

MPI Status-Checking

50

Some MPI calls have a **&status** in their argument list.

The **status** argument is declared to be of type **MPI_Status**, which is actually a struct:

```
typedef struct _MPI_Status
{
    int MPI_SOURCE;
    int MPI_TAG;
    int MPI_ERROR;
} MPI_Status;
```

- MPI_SOURCE is the rank of the node who sent this
- MPI_TAG is the tag used during the send
- MPI_ERROR is the error number that occurred

Example:

```
MPI_Status status;
MPI_Recv(myData, MYDATA_SIZE, MPI_CHAR, THEBOSS, MPI_ANY_TAG, MPI_COMM_WORLD,
&status);

fprintf(stderr, "Rank = %d, Tag = %d, Error Code = %d\n",
status.MPI_SOURCE, status.MPI_TAG, status.MPI_ERROR);
```

50

MPI Error Codes

51

MPI_SUCCESS	No error	MPI_ERR_KEYVAL	Invalid keyval has been passed
MPI_ERR_BUFFER	Invalid buffer pointer	MPI_ERR_NO_MEM	MPI_ALLOC_MEM failed because memory is exhausted
MPI_ERR_COUNT	Invalid count argument	MPI_ERR_BASE	Invalid base passed to MPI_FREE_MEM
MPI_ERR_TYPE	Invalid datatype argument	MPI_ERR_INFO_KEY	Key longer than MPI_MAX_INFO_KEY
MPI_ERR_TAG	Invalid tag argument	MPI_ERR_INFO_VALUE	Value longer than MPI_MAX_INFO_VAL
MPI_ERR_COMM	Invalid communicator	MPI_ERR_INFO_NOKEY	Invalid key passed to MPI_INFO_DELETE
MPI_ERR_RANK	Invalid rank	MPI_ERR_SPAWN	Error in spawning processes
MPI_ERR_REQUEST	Invalid request (handle)	MPI_ERR_PORT	Invalid port name passed to MPI_COMM_CONNECT
MPI_ERR_ROOT	Invalid root	MPI_ERR_SERVICE	Invalid service name passed to MPI_UNPUBLISH_NAME
MPI_ERR_GROUP	Invalid group	MPI_ERR_NAME	Invalid service name passed to MPI_LOOKUP_NAME
MPI_ERR_OP	Invalid operation	MPI_ERR_WIN	Invalid win argument
MPI_ERR_TOPOLOGY	Invalid topology	MPI_ERR_SIZE	Invalid size argument
MPI_ERR_DIMS	Invalid dimension argument	MPI_ERR_DISP	Invalid disp argument
MPI_ERR_ARG	Invalid argument of some other kind	MPI_ERR_INFO	Invalid info argument
MPI_ERR_UNKNOWN	Unknown error	MPI_ERR_LOCKTYPE	Invalid locktype argument
MPI_ERR_TRUNCATE	Message truncated on receive	MPI_ERR_ASSERT	Invalid assert argument
MPI_ERR_OTHER	Known error not in this list	MPI_ERR_RMA_CONFLICT	Conflicting accesses to window
MPI_ERR_INTERNAL	Internal MPI (implementation) error	MPI_ERR_RMA_SYNC	Wrong synchronization of RMA calls
MPI_ERR_IN_STATUS	Error code in its status		
MPI_ERR_PENDING	Pending request		

MPI_ERR_FILE	Invalid file handle
MPI_ERR_NOT_SAME	Collective argument not identical on all processes, or collective routines called in a different order by different processes
MPI_ERR_AMODE	Error related to the amode passed to MPI_FILE_OPEN
MPI_ERR_UNSUPPORTED_DATAREP	Unsupported datatype passed to MPI_FILE_SET_VIEW
MPI_ERR_UNSUPPORTED_OPERATION	Unsupported operation, such as seeking on a file which supports sequential access only
MPI_ERR_NO_SUCH_FILE	File does not exist
MPI_ERR_FILE_EXISTS	File exists
MPI_ERR_BAD_FILE	Invalid file name (e.g. path name too long)
MPI_ERR_ACCESS	Permissions denied
MPI_ERR_NO_SPACE	Not enough space
MPI_ERR_QUOTA	Quota exceeded
MPI_ERR_READ_ONLY	Read-only file or file system
MPI_ERR_FILE_IN_USE	File operation could not be completed as the file is currently open by some process
MPI_ERR_DUP_DATAREP	Conversion functions could not be registered because a data representation identifier that was already defined was passed to MPI_REGISTER_DATAREP
MPI_ERR_CONVERSION	An error occurred in a user supplied data conversion function.
MPI_ERR_LASTCODE	Other I/O error
	Last error code

52

Example: Autocorrelation

53

#B - May 22, 2024

53

Autocorrelation – More than Just a Scatter

54

NUMELEMENTS

↓

Divide NUMELEMENTS into pieces for the NumCpus
(this is what MPI_Scatter does)

↓

NUMELEMENTS NumCpus	NUMELEMENTS NumCpus	NUMELEMENTS NumCpus	NUMELEMENTS NumCpus	NUMELEMENTS NumCpus	NUMELEMENTS NumCpus
------------------------	------------------------	------------------------	------------------------	------------------------	------------------------

↓

But, in the Autocorrelation case, we need MAXSHIFTS more data values for each CPU

↓

NUMELEMENTS NumCpus
