OpenCL

2

- OpenCL consists of two parts: a C/C++-callable API and a C-ish programming language.
- The OpenCL programming language can run on NVIDIA GPUs, AMD GPUs, Intel CPUs, Intel GPUs, mobile devices, and (supposedly) FPGAs (Field-Programmable Gate Arrays).
- But, OpenCL is at its best on compute devices with large amounts of **data parallelism**, which usually implies GPU usage.
- You break your computational problem up into lots and lots of small pieces. Each piece gets farmed out to threads on the GPU.
- Each thread wakes up and is able to ask questions about where it lives in the entire collection of (thousands of) threads. From that, it can tell what it is supposed to be working on.
- OpenCL can share data, and interoperate, with OpenGL
- There is a JavaScript implementation of OpenCL, called WebCL
- There is a JavaScript implementation of OpenGL, called WebGL
- WebCL can share data, and interoperate, with WebGL
- The GPU does not have a stack, and so the OpenCL C-ish programming language cannot do recursion and cannot make function calls. It also can't use pointers.

4

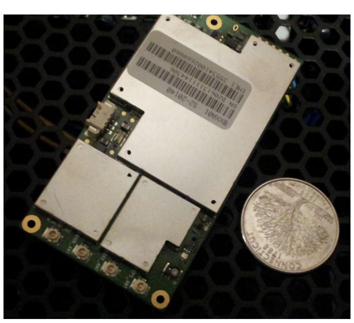
Example of using OpenCL in a System-on-a-Chip: Qualcomm Node – Full Linux and OpenCL

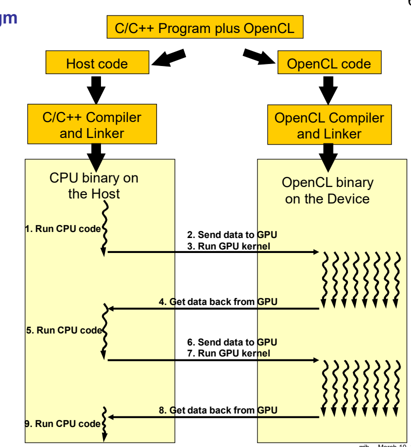
5



5

The OpenCL Paradigm

6



6

OpenCL wants you to break the problem up into Pieces

7

If you were writing in **C/C++**, you would say:

```
void
ArrayMult( int n, float *a, float *b, float *c)
{
        for ( int i = 0;  i < n;  i++ )
                c[ i ] = a[ i ] * b[ i ];
}
```

If you were writing in **OpenCL**, you would say:

```
kernel
void
ArrayMult( global float *dA, global float *dB, global float *dC)
{
        int  gid = get_global_id ( 0 );
        dC[gid] = dA[gid] * dB[gid];
}
```

Think of this as having an implied for-loop around it, looping through all possible values of *gid*

Oregon State University Computer Graphics

mjb – March 10, 2022

7

The OpenCL Language also supports Vector Parallelism

8

OpenCL code can be vector-oriented, meaning that it can perform a single instruction on multiple data values at the same time (SIMD).

Vector data types are: char*n*, int*n*, float*n*, where *n* = 2, 4, 8, or 16.

```
float4  f, g;
f = (float4)( 1.f, 2.f, 3.f, 4.f );

float16  a16, x16, y16, z16;

f.x = 0.;
f.xy = g.zw;
x16.s89ab = f;

float16  a16  =  x16 * y16  +  z16;
```

(Note: just because the language supports it, doesn't mean the hardware does.)

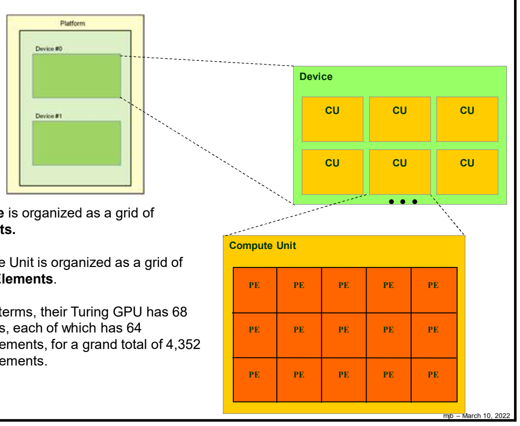
8

Compute Units and Processing Elements are Arranged in Grids

9



A GPU **Device** is organized as a grid of **Compute Units.**

Each Compute Unit is organized as a grid of **Processing Elements**.

So in NVIDIA terms, their Turing GPU has 68 Compute Units, each of which has 64 Processing Elements, for a grand total of 4,352 Processing Elements.

Oregon State University Computer Graphics

mjb – March 10, 2022

9

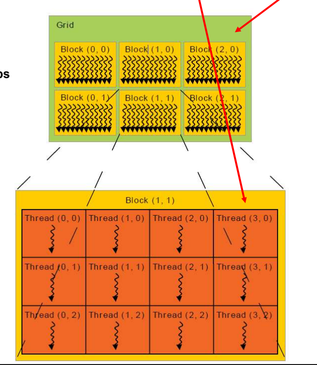
Work-Groups are Arranged in Grids

10

- The GPU's workload is divided into a **Grid of Work-Groups**
- Each Block's workload is divided into a **Grid of Work-Items**

Grid of Work-Groups

Grid of Work-Items



Oregon State University Computer Graphics

mjb – March 10, 2022

10

OpenCL Software Terminology: Work-Groups and Work-Items are Arranged in Grids

11

An OpenCL program is organized as a grid of **Work-Groups**.

Each Work-Group is organized as a grid of **Work-Items**.

In terms of hardware, a Work-Group runs on a Compute Unit and a Work-Item runs on a Processing Element (PE).

One thread is assigned to each Work-Item.

Threads are swapped on and off the PEs.

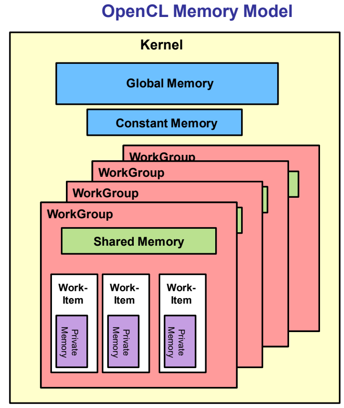
Computer Graphics

mjb – March 10, 2022

11

OpenCL Memory Model

12



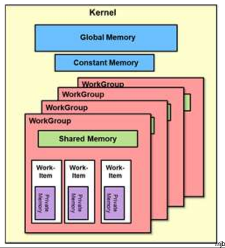
Oregon State University Computer Graphics

mjb – March 10, 2022

12

Rules

- Threads can share memory with the other Threads in the same Work-Group
- Threads can synchronize with other Threads in the same Work-Group
- Global and Constant memory is accessible by all Threads in all Work-Groups
- Global and Constant memory is often cached inside a Work-Group
- Each Thread has registers and private memory
- Each Work-Group has a maximum number of registers it can use. These are divided equally among all its Threads

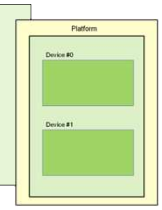


Querying the Number of Platforms (usually one)

```
cl_uint  numPlatforms;
status = clGetPlatformIDs( 0, NULL, &numPlatforms );
if( status != CL_SUCCESS )
        fprintf( stderr, "clGetPlatformIDs failed (1)\n" );

fprintf( stderr, "Number of Platforms = %d\n", numPlatforms );

cl_platform_id  * platforms = new  cl_platform_id[ numPlatforms  ];
status = clGetPlatformIDs( numPlatforms, platforms, NULL );
if( status != CL_SUCCESS )
        fprintf( stderr, "clGetPlatformIDs failed (2)\n" );
```



This way of querying information is a recurring OpenCL pattern (get used to it):

	How many to get	Where to put them	How many total there are	
status = **clGetPlatformIDs**(	0,	NULL,	&numPlatforms	);
status = **clGetPlatformIDs**(	numPlatforms,	platforms,	NULL	);

OpenCL Error Codes

This one is #define'd as zero.
All the others are negative.

A Way to Print OpenCL Error Codes – get this from our Reference Page

```
struct errorcode
{
        cl_int          statusCode;
        char *          meaning;
}
ErrorCodes[ ] =
{
        { CL_SUCCESS,                           " "                             },
        { CL_DEVICE_NOT_FOUND,                  "Device Not Found"              },
        { CL_DEVICE_NOT_AVAILABLE,              "Device Not Available"          },
                . . .
        { CL_INVALID_MIP_LEVEL,                 "Invalid MIP Level"             },
        { CL_INVALID_GLOBAL_WORK_SIZE,          "Invalid Global Work Size"      },
};

void
PrintCLError( cl_int errorCode,  char * prefix,  FILE *fp )
{
        if( errorCode == CL_SUCCESS )
                return;

        const int numErrorCodes = sizeof( ErrorCodes ) / sizeof( struct errorcode );
        char * meaning = " ";
        for( int i = 0; i < numErrorCodes; i++ )
        {
                if( errorCode == ErrorCodes[i].statusCode )
                {
                        meaning = ErrorCodes[i].meaning;
                        break;
                }
        }

        fprintf( fp, "%s %s\n", prefix, meaning );
}
```

Querying the Number of Devices on a Platform

```
// find out how many devices are attached to each platform and get their ids:

status = clGetDeviceIDs( platform, CL_DEVICE_TYPE_ALL, 0,          NULL, &numDevices );

devices = new cl_device_id[ numDevices ];

status = clGetDeviceIDs( platform, CL_DEVICE_TYPE_ALL, numDevices, devices,     NULL     );
```

Getting Just the GPU Device(s)

```
cl_device_id  device;

status = clGetDeviceIDs( platform, CL_DEVICE_TYPE_GPU, 1, &device,     NULL      );
```

Querying the Device (this is *really* useful!), I

```
// find out how many platforms are attached here and get their ids:

cl_uint numPlatforms;
status = clGetPlatformIDs( 0, NULL, &numPlatforms );
if( status != CL_SUCCESS )
        fprintf( stderr, "clGetPlatformIDs failed (1)\n" );

fprintf( OUTPUT, "Number of Platforms = %d\n", numPlatforms );

cl_platform_id *platforms = new cl_platform_id[ numPlatforms ];
status = clGetPlatformIDs( numPlatforms, platforms, NULL );
if( status != CL_SUCCESS )
        fprintf( stderr, "clGetPlatformIDs failed (2)\n" );

cl_uint numDevices;
cl_device_id *devices;

for( int i = 0; i < (int)numPlatforms; i++ )
{
        fprintf( OUTPUT, "Platform #%d:\n", i );
        size_t size;
        char *str;

        clGetPlatformInfo( platforms[i], CL_PLATFORM_NAME, 0, NULL, &size );
        str = new char [ size ];
        clGetPlatformInfo( platforms[i], CL_PLATFORM_NAME, size, str, NULL );
        fprintf( OUTPUT, "\tName    = '%s'\n", str );
        delete[ ] str;

        clGetPlatformInfo( platforms[i], CL_PLATFORM_VENDOR, 0, NULL, &size );
        str = new char [ size ];
        clGetPlatformInfo( platforms[i], CL_PLATFORM_VENDOR, size, str, NULL );
        fprintf( OUTPUT, "\tVendor  = '%s'\n", str );
        delete[ ] str;
```

Querying the Device, II

19

```
clGetPlatformInfo( platforms[i], CL_PLATFORM_VERSION, 0, NULL, &size );
str = new char [ size ];
clGetPlatformInfo( platforms[i], CL_PLATFORM_VERSION, size, str, NULL );
fprintf( OUTPUT, "\tVersion = '%s'\n", str );
delete[ ] str;

clGetPlatformInfo( platforms[i], CL_PLATFORM_PROFILE, 0, NULL, &size );
str = new char [ size ];
clGetPlatformInfo( platforms[i], CL_PLATFORM_PROFILE, size, str, NULL );
fprintf( OUTPUT, "\tProfile = '%s'\n", str );
delete[ ] str;

// find out how many devices are attached to each platform and get their ids:

status = clGetDeviceIDs( platforms[i], CL_DEVICE_TYPE_ALL, 0, NULL, &numDevices );
if( status != CL_SUCCESS )
      fprintf( stderr, "clGetDeviceIDs failed (2)\n" );

devices = new cl_device_id[ numDevices ];
status = clGetDeviceIDs( platforms[i], CL_DEVICE_TYPE_ALL, numDevices, devices, NULL );
if( status != CL_SUCCESS )
      fprintf( stderr, "clGetDeviceIDs failed (2)\n" );

for( int j = 0; j < (int)numDevices; j++ )
{
      fprintf( OUTPUT, "\tDevice #%d:\n", j );
      size_t size;
      cl_device_type type;
      cl_uint ui;
      size_t sizes[3] = { 0, 0, 0 };

      clGetDeviceInfo( devices[j], CL_DEVICE_TYPE, sizeof(type), &type, NULL );
      fprintf( OUTPUT, "\t\tType = 0x%04x = ", type );
```

19

Querying the Device, III

20

```
            switch( type )
            {
                  case CL_DEVICE_TYPE_CPU:
                        fprintf( OUTPUT, "CL_DEVICE_TYPE_CPU\n" );
                        break;
                  case CL_DEVICE_TYPE_GPU:
                        fprintf( OUTPUT, "CL_DEVICE_TYPE_GPU\n" );
                        break;
                  case CL_DEVICE_TYPE_ACCELERATOR:
                        fprintf( OUTPUT, "CL_DEVICE_TYPE_ACCELERATOR\n" );
                        break;
                  default:
                        fprintf( OUTPUT, "Other...\n" );
                        break;
            }
            clGetDeviceInfo( devices[j], CL_DEVICE_VENDOR_ID, sizeof(ui), &ui, NULL );
            fprintf( OUTPUT, "\t\tDevice Vendor ID = 0x%04x\n", ui );

            clGetDeviceInfo( devices[j], CL_DEVICE_MAX_COMPUTE_UNITS, sizeof(ui), &ui, NULL );
            fprintf( OUTPUT, "\t\tDevice Maximum Compute Units = %d\n", ui );

            clGetDeviceInfo( devices[j], CL_DEVICE_MAX_WORK_ITEM_DIMENSIONS, sizeof(ui), &ui, NULL );
            fprintf( OUTPUT, "\t\tDevice Maximum Work Item Dimensions = %d\n", ui );

            clGetDeviceInfo( devices[j], CL_DEVICE_MAX_WORK_ITEM_SIZES, sizeof(sizes), sizes, NULL );
            fprintf( OUTPUT, "\t\tDevice Maximum Work Item Sizes = %d x %d x %d\n", sizes[0], sizes[1], sizes[2] );

            clGetDeviceInfo( devices[j], CL_DEVICE_MAX_WORK_GROUP_SIZE, sizeof(size), &size, NULL );
            fprintf( OUTPUT, "\t\tDevice Maximum Work Group Size = %d\n", size );

            clGetDeviceInfo( devices[j], CL_DEVICE_MAX_CLOCK_FREQUENCY, sizeof(ui), &ui, NULL );
            fprintf( OUTPUT, "\t\tDevice Maximum Clock Frequency = %d MHz\n", ui );
      }
}
```

20

Typical Values from Querying the Device

21

```
Number of Platforms = 1
Platform #0:
        Name    = 'NVIDIA CUDA'
        Vendor  = 'NVIDIA Corporation'
        Version = 'OpenCL 1.1 CUDA 4.1.1'
        Profile = 'FULL_PROFILE'
        Device #0:
                Type = 0x0004 = CL_DEVICE_TYPE_GPU
                Device Vendor ID = 0x10de
                Device Maximum Compute Units = 15
                Device Maximum Work Item Dimensions = 3
                Device Maximum Work Item Sizes = 1024 x 1024 x 64
                Device Maximum Work Group Size = 1024
                Device Maximum Clock Frequency = 1401 MHz
                Kernel Maximum Work Group Size = 1024
                Kernel Compile Work Group Size = 0 x 0 x 0
                Kernel Local Memory Size = 0
```

Oregon State University Computer Graphics

21

Querying to see what extensions are supported on this device

22

```
size_t    extensionSize;

clGetDeviceInfo( device, CL_DEVICE_EXTENSIONS,        0,          NULL,     &extensionSize );
char *extensions = new char [extensionSize];
clGetDeviceInfo( devices, CL_DEVICE_EXTENSIONS, extensionSize, extensions,      NULL );

fprintf( stderr, "\nDevice Extensions:\n" );
for( int i = 0; i < (int)strlen(extensions); i++ )
{
            if( extensions[  i  ] == ' ' )
                        extensions[  i  ] = '\n';
}
fprintf( stderr, "%s\n", extensions );
delete [  ] extensions;
```

Oregon State University Computer Graphics

22

Querying to see what extensions are supported on this device

23

This is the big one you are looking for. It shows that this OpenCL system can interoperate with OpenGL.

This one is handy too. It shows that this OpenCL system can support 64-bit floating point (i.e., double precision).

```
Device Extensions:
cl_khr_byte_addressable_store
cl_khr_icd
cl_khr_gl_sharing
cl_nv_d3d9_sharing
cl_nv_d3d10_sharing
cl_khr_d3d10_sharing
cl_nv_d3d11_sharing
cl_nv_compiler_options
cl_nv_device_attribute_query
cl_nv_pragma_unroll

cl_khr_global_int32_base_atomics
cl_khr_global_int32_extended_atomics
cl_khr_local_int32_base_atomics
cl_khr_local_int32_extended_atomics
cl_khr_fp64
```

Oregon State University Computer Graphics

23

Steps in Creating and Running an OpenCL program

24

1. Program header
2. Allocate the host memory buffers
3. Create an OpenCL context
4. Create an OpenCL command queue
5. Allocate the device memory buffers
6. Write the data from the host buffers to the device buffers
7. Read the kernel code from a file
8. Compile and link the kernel code
9. Create the kernel object
10. Setup the arguments to the kernel object
11. Enqueue the kernel object for execution
12. Read the results buffer back from the device to the host
13. Clean everything up

Oregon State University Computer Graphics

24

1. .cpp Program Header
25

```
#include <stdio.h>
#include <math.h>
#include <string.h>
#include <stdlib.h>
#include <omp.h>        // for timing

#include "cl.h"
```

Oregon State University
Computer Graphics

mjb – March 10, 2022

25

2. Allocate the Host Memory Buffers
26

```
// allocate the host memory buffers:

float * hA = new float [ NUM_ELEMENTS ];
float * hB = new float [ NUM_ELEMENTS ];
float * hC = new float [ NUM_ELEMENTS ];

// fill the host memory buffers:

for( int i = 0; i < NUM_ELEMENTS; i++ )
{
        hA[ i ] = hB[ i ] =  sqrtf(  (float) i  );
}

// array size in bytes (will need this later):

size_t  dataSize = NUM_ELEMENTS * sizeof( float );

 // opencl function return status:

cl_int  status;                        // test against CL_SUCCESS
```

This could have also been done like this:

float hA[NUM_ELEMENTS];

Global memory and the heap typically have lots more space than the stack does. So, typically, you do not want to allocate a large array like this as a local variable.

(Here, it's being done on the heap. It could also have been done in global memory.)

Oregon State University
Computer Graphics

mjb – March 10, 2022

26

3. Create an OpenCL Context
27

```
cl_context context = clCreateContext( NULL, 1, &device, NULL, NULL, &status );
```

```
// create a context:

cl_context context = clCreateContext( NULL, 1, &device, NULL, NULL, &status );
```

properties
the device
Pass in user data
one device
Callback
returned status

Oregon State University
Computer Graphics

mjb – March 10, 2022

27

4. Create an OpenCL Command Queue
28

```
// create a command queue:

cl_command_queue  cmdQueue = clCreateCommandQueue( context, device, 0, &status );
```

```
cl_command_queue cmdQueue = clCreateCommandQueue( context, device, 0, &status );
```

the context
properties
the device
returned status

Oregon State University
Computer Graphics

mjb – March 10, 2022

28

5. Allocate the Device Memory Buffers
29

```
// allocate memory buffers on the device:

cl_mem  dA = clCreateBuffer( context, CL_MEM_READ_ONLY,   dataSize, NULL, &status );
cl_mem  dB = clCreateBuffer( context, CL_MEM_READ_ONLY,   dataSize, NULL, &status );
cl_mem  dC = clCreateBuffer( context, CL_MEM_WRITE_ONLY, dataSize, NULL, &status );
```

```
cl_mem  dA = clCreateBuffer( context, CL_MEM_READ_ONLY,   dataSize, NULL, &status );
```

how this buffer is restricted
buffer data already allocated
bytes
returned status

The read and write terminology is *with respect to the OpenCL device*.
So, CL_MEM_READ_ONLY means that the OpenCL device can only get this data – it can't send it back to the host CPU. Other options are CL_MEM_WRITE_ONLY and CL_MEM_READ_WRITE.

Oregon State University
Computer Graphics

mjb – March 10, 2022

29

6. Write the Data from the Host Buffers to the Device Buffers
30

```
// enqueue the 2 commands to write data into the device buffers:

status = clEnqueueWriteBuffer( cmdQueue, dA, CL_FALSE, 0, dataSize, hA, 0, NULL, NULL );
status = clEnqueueWriteBuffer( cmdQueue, dB, CL_FALSE, 0, dataSize, hB, 0, NULL, NULL );
```

```
status = clEnqueueWriteBuffer( cmdQueue, dA, CL_FALSE, 0, dataSize, hA, 0, NULL, NULL );
```

command queue
want to block until done?
bytes
events
event object
device buffer
offset
host buffer
event wait list

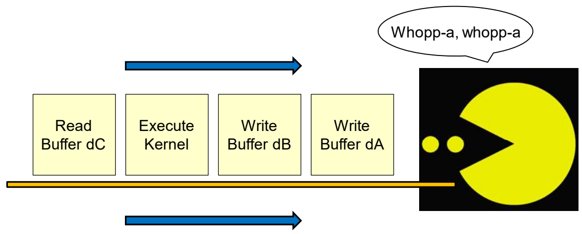
30

Enqueuing Works Like a Conveyer Belt
31



Oregon State University Computer Graphics

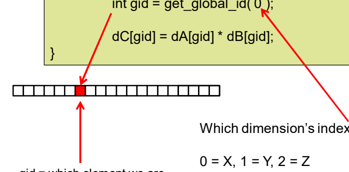
mjb – March 10, 2022

31

The .cl File
32

```
kernel
void
ArrayMult(  global const float *dA,  global const float *dB,  global float *dC )
{
        int gid = get_global_id( 0 );

        dC[gid] = dA[gid] * dB[gid];
}
```



gid = which element we are dealing with right now.

Which dimension's index are we fetching?

0 = X, 1 = Y, 2 = Z

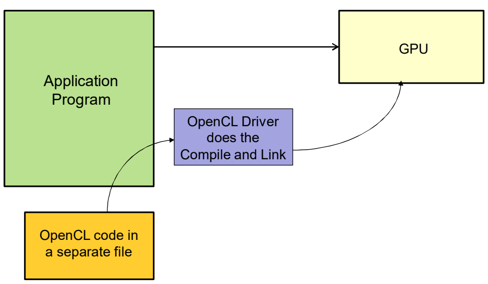
Since this is a 1D problem, X is the only index we need to get.

Oregon State University Computer Graphics

mjb – March 10, 2022

32

OpenCL code is compiled in the Driver . . .
33



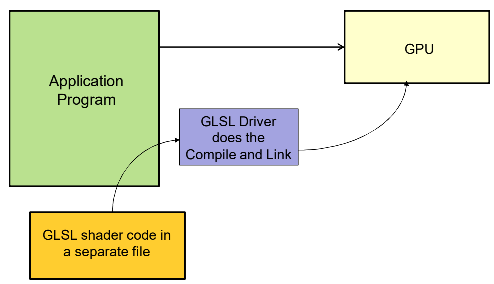
```
kernel void
ArrayMult( global float *A, global float *B, global float *C )
{
        int gid = get_global_id ( 0 );

        C[gid] = A[gid] * B[gid];
}
```

mjb – March 10, 2022

33

(. . . just like OpenGL's GLSL Shader code is compiled in the driver)
34



```
void main( )
{
        vec3 newcolor = texture2D( uTexUnit, vST) ).rgb;
        newcolor = mix( newcolor, vColor.rgb, uBlend );
        gl_FragColor = vec4(u LightIntensity*newcolor, 1. );
}
```

University Computer Graphics

mjb – March 10, 2022

34

7. Read the Kernel Code from a File into a Character Array
35

"r" should work, since the .cl file is pure ASCII text, but some people report that it doesn't work unless you use "rb"

Watch out for the '\r' + '\n' problem! (See the next slide.)

```
const char *CL_FILE_NAME = { "arraymult.cl" };
        . . .

FILE *fp = fopen( CL_FILE_NAME, "r" );
if( fp == NULL )
{
        fprintf( stderr, "Cannot open OpenCL source file '%s'\n", CL_FILE_NAME );
        return 1;
}

// read the characters from the opencl kernel program:

fseek( fp, 0, SEEK_END );
size_t  fileSize = ftell( fp );
fseek( fp, 0, SEEK_SET );
char *clProgramText =  new  char[ fileSize+1 ];
size_t  n = fread( clProgramText, 1, fileSize, fp );
clProgramText[fileSize] = '\0';
fclose( fp );
```

Oregon State University Computer Graphics

mjb – March 10, 2022

35

A Warning about Editing on Windows and Running on Linux
36

Some of you will end up having strange, unexplainable problems with your csh scripts, .cpp prograns, or .cl programs. This could be because you are typing your code in on Windows (using Notepad or Wordpad or Word) and then running it on Linux. Windows likes to insert an extra carriage return ('\r') at the end of each line, which Linux interprets as a garbage character.

You can test this by typing the Linux command:

od -c loop.csh

which will show you all the characters, even the '\r' (which you don't want) and the '\n' (newlines, which you do want).

To get rid of the carriage returns, enter the Linux command:

tr -d '\r' < loop.csh > loop1.csh

Then run loop1.csh

Or, on some systems, there is a utility called *dos2unix* which does this for you:

dos2unix < loop.csh > loop1.csh

Sorry about this. Unfortunately, this is a fact of life when you mix Windows and Linux.

Something new: Intermediate Compilation

37

- You pre-compile your OpenCL code with an external compiler
- Your OpenCL code gets turned into an intermediate form known as SPIR-V
- SPIR-V gets turned into fully-compiled code at runtime

OpenCL Source → You do: **External OpenCL Compiler** → SPIR-V → Driver does: **Compiler in driver** → Vendor-specific code

Advantages:

1. Software vendors don't need to ship their OpenCL source
2. Syntax errors appear during the SPIR-V step, not during runtime
3. Software can launch faster because half of the compilation has already taken place
4. This guarantees a common front-end syntax
5. This allows for other language front-ends

37

8. Compile and Link the Kernel Code

38

```
// create the kernel program on the device:

char * strings [ 1 ];                    // an array of strings
strings[0] = clProgramText;
cl_program  program = clCreateProgramWithSource( context, 1, (const char **)strings, NULL, &status );
delete  [ ]  clProgramText;

// build the kernel program on the device:

char *options = { "" };
status = clBuildProgram( program, 1, &device, options, NULL, NULL );
if( status != CL_SUCCESS )
{                                        // retrieve and print the error messages:
        size_t  size;
        clGetProgramBuildInfo( program, devices[0], CL_PROGRAM_BUILD_LOG, 0, NULL, &size );
        cl_char *log = new cl_char[ size ];
        clGetProgramBuildInfo( program, devices[0], CL_PROGRAM_BUILD_LOG, size, log, NULL );
        fprintf( stderr, "clBuildProgram failed:\n%s\n", log );
        delete [ ] log;
}
```

38

How does that array-of-strings thing actually work?

39

```
char *ArrayOfStrings[3];
ArrayOfStrings[0] = …one commonly-used function…";
ArrayOfStrings[1] = " . . . another commonly-used function. . . ";
ArrayOfStrings[2] = " . . . the real OpenCL code . .. ";
cl_program  program = clCreateProgramWithSource( context, 1, (const char **) ArrayOfStrings, NULL, &status );
```

These are two ways to provide a *single* character buffer:

```
char *buffer[1];
buffer[0] = " . . . the entire OpenCL code . . . ";
cl_program  program = clCreateProgramWithSource( context, 1, (const char **) buffer, NULL, &status );
```

```
char *buffer = " . . . the entire OpenCL code . . . ";
cl_program  program = clCreateProgramWithSource( context, 1, (const char **) &buffer, NULL, &status );
```

39

Why use an array of strings to hold the OpenCL program, instead of just a single string?

40

1. You can use the same OpenCL source and insert the appropriate "#defines" at the beginning
2. You can insert a common header file (≈ a .h file)
3. You can simulate a "#include" to re-use common pieces of code

11. Enqueue the Kernel Object for Execution

43

```
size_t  globalWorkSize[ 3 ] = { NUM_ELEMENT, 1, 1 };
size_t  localWorkSize[ 3 ]  = { LOCAL_SIZE,    1, 1 } ;

Wait( cmdQueue );        // will be covered in the OpenCL event notes

double time0 = omp_get_wtime( );

status = clEnqueueNDRangeKernel( cmdQueue, kernel, 1, NULL, globalWorkSize, localWorkSize, 0, NULL, NULL );

Wait( cmdQueue );        // will be covered in the OpenCL event notes

double time1 = omp_get_wtime( );
```

 # dimensions **# events** **event object**

status = clEnqueueNDRangeKernel(cmdQueue, kernel, 1, NULL, globalWorkSize, localWorkSize, 0, NULL, NULL);

global work offset (always NULL) **event wait list**

Writing out the .cl Program's Binary Code

52

```
size_t binary_sizes;
status = clGetProgramInfo( Program, CL_PROGRAM_BINARY_SIZES, 0, NULL, &binary_sizes );

size_t  size;
status = clGetProgramInfo( Program, CL_PROGRAM_BINARY_SIZES, sizeof(size_t), &size, NULL );

unsigned char *binary = new unsigned char [ size ];
status = clGetProgramInfo( Program, CL_PROGRAM_BINARIES, size, &binary, NULL );

FILE *fpbin = fopen( "particles.nv", "wb" );
if( fpbin == NULL )
{
        fprintf( stderr, "Cannot create 'particles.bin'\n" );
}
else
{
        fwrite( binary, 1, size, fpbin );
        fclose( fpbin );
}
delete [ ] binary;
```

Oregon State University
Computer Graphics

mjb – March 10, 2022

52

Importing that Binary Code back In:
8. Compile and Link the Kernel Code

53

Instead of doing this:

```
char * strings [ 1 ];
strings[0] = clProgramText;
cl_program  program = clCreateProgramWithSource( context, 1, (const char **)strings, NULL, &status );
delete  [  ]  clProgramText;
```

You would do this:

```
unsigned char byteArray[ numBytes ];
cl_program  program = clCreateProgramWithBinary( context,  1, &device,  &numBytes, &byteArray,  &binaryStatus,  &status );
delete  [  ] byteArray;
```

And you still have to do this:

```
char *options = { "" };
status = clBuildProgram( program, 1, &device, options, NULL, NULL );
if( status != CL_SUCCESS )
{
                size_t  size;
                clGetProgramBuildInfo( program, device, CL_PROGRAM_BUILD_LOG, 0, NULL, &size );
                cl_char *log = new cl_char[ size ];
                clGetProgramBuildInfo( program, device, CL_PROGRAM_BUILD_LOG, size, log, NULL );
                fprintf( stderr, "clBuildProgram failed:\n%s\n", log );
                delete [  ] log;
}
```
