A Warning about the Note Coverage

What Processing can do

What I know

What the notes cover
Why Do We Have These Notes?

Processing has thousands of "buttons" you can press. These notes are here to show you what certain combinations of buttons do in order to learn them the first time, and to remind you later when you’ve forgotten.

http://xkcd.com
A “program” is a set of instructions that you can store and playback later. This sounds like a computer-thing, but the idea of a “program” has been around for hundreds of years.

The earliest known "program" is (apparently) a mechanical music playback device developed in Baghdad in the 9th century. ([https://en.wikipedia.org/wiki/Music_box](https://en.wikipedia.org/wiki/Music_box)) You can find a similar device in Oregon today…
Music Box Programming

… at the Albany (Oregon) Carousel and Museum
Music Box Programming

Albany Carousel and Museum
Another Historic Example is Textile Programming

Jacquard Loom, circa 1804
Textile Programming

Jacquard Loom, circa 1804
And, of course, there is the ever-fun Player Piano

https://en.wikipedia.org/wiki/Piano_roll
Computers Eventually Imitated Historic Methods using Punch Cards

Where to Find Processing

In your favorite web browser, go to: https://p5js.org/
Here’s what you will see:

- Go here to start using Processing
- These are good links to check out!
- Processing includes a collection of spectacular example programs
Click on the **Editor** link, or navigate to: [https://editor.p5js.org/](https://editor.p5js.org/)
Either way, here's what you will see:
Running Processing

- Menu headers
- Run your program
- Stop the program
- Program-writing/editing area
- Processing message area

```
1 function setup() {
2   createCanvas(400, 400);
3 }
4
5 function draw() {
6   background(220);
7 }
```
Now, click this button!

Here’s what you will get

Don’t worry – it will get better 😊
Writing Processing Programs
With *Processing*, you get to do real-world programming that gives you visual output. You get to make cool pictures at the same time you are learning to program. This opens up a world of opportunities for you!
First, Remember How Graph Paper Works

The Greek letter delta, $\Delta$, is the mathematics symbol for “the change in”
This is the “Graph Paper” System for Processing Programs

(X=0, Y=0) → (X=width - 1, Y=0)

(X=100, Y=200)

ΔX=150

ΔY=50

(X=0, Y=height - 1) → (X=width - 1, Y=height - 1)
Colors for Computer Graphics Monitors: Additive Colors (RGB)

Colors are formed with combinations of **red**, **green**, and **blue**.

The smallest number you can use for each is **0**
The largest number you can use for each is **255**

function setup() {
    createCanvas(800, 600);
    background(200, 200, 255);
    stroke(0, 0, 0);
    fill(255, 50, 50);
}

function draw() {
    rect(100, 200, 150, 50);
}

You must add code to the setup() function. Processing calls this once when your program starts.

You must add code to the draw() function. Processing calls this every time it wants to re-draw the scene.

You don't need to type all this in – you can copy-and-paste it from these notes!
Running Your Processing Programs

Click here to run your program

```javascript
1 function
2 setup( )
3 {
4   createCanvas( 800, 600 );
5   background( 200, 200, 255 );
6   stroke( 0, 0, 0 );
7   fill( 255, 50, 50 );
8 }
9 function
10 draw( )
11 {
12   rect( 100, 200, 150, 50 );
13 }
14 }
```
Enjoying the Output of Your First Processing Program

Don’t worry – it will get better 😊
## Some Functions to use when Writing Processing Programs

<table>

</tr>
</tbody>
</table>
Variables

```javascript
function draw( )
{
    let x = 100;
    let y = 2*x;
    rect( x, y, 150, 50 );
}
```

Arithmetic operations in programming are:

- `+` Addition
- `-` Subtraction
- `*` Multiplication
- `/` Division
- `( )` Grouping
Variables are the process of replacing numbers with symbols in order to generalize a computation to work in more than one situation.

```
function draw() {
  let x = 100;
  let y = 200;
  rect(x, y, 150, 50);
}
```

"let" just says that you are defining a variable.
Variables – using symbols instead of just numbers

We can use variables to create relationships

```javascript
function draw()
{
  let x = 100;
  let y = 2*x;
  rect(x, y, 150, 50);
}
```

When you assign a number to `x`, then `y` will automatically be twice as big as whatever you set `x` to be.

Arithmetic operations in programming are:
- `+` Addition
- `-` Subtraction
- `*` Multiplication
- `/` Division
- `( )` Grouping
Drawing Lines and Polygons
Rectangles are Fun, but Arbitrary Lines and Polygons are Funner

Easy – just list the coordinates:

```java
beginShape();
  vertex( x0, y0 );
  vertex( x1, y1 );
  vertex( x2, y2 );
  ... 
endShape();
```
Rectangles are Fun, but Arbitrary Lines and Polygons are Funner

```java
function draw( )
{
    beginShape( );
        vertex( 100, 100 );
        vertex( 100, 400);
        vertex( 200, 400);
        vertex( 300, 300);
        vertex( 400, 50 );
    endShape( );
}
```
for-loops
Drawing One Rectangle is Pretty Straightforward

```plaintext
rect( 100, 200, 150, 50 );
```
But, This Gets Awfully Boring if You Want to Draw 100 Rectangles!

```plaintext
rect( 100, 200, 150, 50 );
rect( 110, 210, 150, 50 );
rect( 120, 220, 150, 50 );
```
Repeating a code pattern is a common theme in programming.

This line is called a “for-loop”. It is very handy for repeating patterns of code.

The for-loop executes the commands in the curly braces a bunch of times. Using it looks like this:

1. Do this equation once at the start
2. Keep looping as long as this test is true
3. Do this at the end of one loop, but before the start of the next one

Yes, the semi-colons (;) are necessary!
for-loops to the Rescue!
Drawing Circles and Other Regular Polygons, I
First, We Need to Understand Something about Angles

If a circle has a radius of 1.0, then we can march around it by simply changing the angle that we call $\theta$. 
First, We Need to Understand Something about Angles

One of the things we notice is that each angle $\theta$ has a unique $X$ and $Y$ that goes with it.

The $X$ and $Y$ are different for each $\theta$. 
First, We Need to Understand Something about Angles

Centuries ago, people developed tables of those X and Y values as functions of $\theta$. They called the X values \textit{cosines} and the Y values \textit{sines}. These are abbreviated cos and sin.
In Earlier Times, People Looked up Sines and Cosines in Books
and on Slide Rules –
Fortunately We Now Have Calculators and Computers
Cosines and Sines are Really Ratios

If we were to double the radius of the circle, all of the X’s and Y’s would also double.

So, really the cos and sin are ratios of X and Y to the circle Radius

\[
\cos \theta = \frac{X}{R}
\]

\[
\sin \theta = \frac{Y}{R}
\]
So, if we know the circle Radius, and we march through a series of $\theta$ angles, we can determine all of the X’s and Y’s that we need to draw a circle.

\[
\cos \theta = \frac{X}{R} \quad X = R \times \cos \theta
\]

\[
\sin \theta = \frac{Y}{R} \quad Y = R \times \sin \theta
\]
function Shape( xc, yc, r, numsegs )
{
    let dang = (2.*PI) / float( numsegs );
    let ang = 0.;
    beginShape( );
    for( let i = 0; i <= numsegs; i = i + 1 )
    {
        let x = xc + r * cos(ang);
        let y = yc + r * sin(ang);
        vertex( x, y );
        ang = ang + dang;
    }
    endShape( );
}

numsegs is the number of line segments making up the circumference of the circle.

numsegs=36 gives a nice circle.
5 gives a pentagon.
8 gives an octagon.
4 gives you a square. Etc.

Why 2.*PI (= 2π)?

dang = Δang = change in ang as we go around the circle
Why 2.*PI (= 2π)?

let dang = (2.*PI) / float( numsegs );

We commonly measure angles in degrees, but scientists, engineers, and computers like to measure angles in something else called radians.

There are 360° (degrees) in a complete circle.
There are 2π (~6.28) radians in a complete circle.

The built-in cos( ) and sin( ) functions expect angles to be given in radians.

Processing has built-in functions to convert between the two:

let rad = radians( deg );
let deg = degrees( rad );
function draw( )
{
    fill(255, 50, 50);
    Shape(200, 200, 100, 36);
    fill(50, 255, 50);
    Shape(300, 300, 100, 5);
    fill(50, 50, 255);
    Shape(400, 400, 100, 8);
}
function Shape2( xc, yc, rx, ry, numsegs )
{
  let dang = (2.*PI) / float( numsegs );
  let ang = 0.;
  beginShape( );

  for( let i = 0; i <= numsegs; i = i + 1 )
  {
    let x = xc + rx * cos(ang);
    let y = yc + ry * sin(ang);
    vertex( x, y );
    ang = ang + dang;
  }

  endShape( );
}

And, there is no reason the X and Y radii need to be the same…
function draw( )
{
    fill( 255, 50, 50 );
    Shape2( 200, 200, 150, 75, 36 );

    fill( 50, 255, 50 );
    Shape2( 300, 300, 150, 75, 5 );

    fill( 50, 50, 255 );
    Shape2( 400, 400, 150, 75, 8 );
}

And, there is no reason the X and Y radii need to be the same…
The Processing \textit{map()} Function
More Sophisticated Relationships:

The *map( )* function

This function takes an input value, the range of values it lives between, and the range of output values. It returns the output value that corresponds to the input value.

So, for example, if we wanted to turn an *x* value into a red color, we might say:

```
let red = int(map(x, 0, 399, 0, 255));
```

![Diagram showing the relationship between input and output values.]
function draw( )
{
    for( let x = 0 ; x < 400 ; x = x + 10 )
    {
        let y = x;
        let red = int( map( x, 0, 399, 0, 255 ) );
        let green = int( map( y, 0, 399, 0, 255 ) );
        fill( red, green, 0 );
        rect( x, y, 150, 50 );
    }
}
More Sophisticated Relationships:
The \textit{map( )} function

\begin{verbatim}
function draw( )
{
    for( let x = 0 ; x < 400 ; x = x + 10 )
    {
        let y = x;
        let red = int(  map( x, 0, 399, 0, 255 ) );
        let green = int(  map( y, 0, 399, 0, 255 ) );
        green = 3 * green / 4;
        fill( red, green, 0 );
        rect( x, y, 150, 50 );
    }
}
\end{verbatim}
The `map()` function can also do blending

```javascript
function draw( ) {
    for ( let x = 0 ; x < 400 ; x = x + 10 )
    {
        let y = x;
        let red = int( map( x, 0, 399, 0, 255 ) ),
        let green = int( map( y, 0, 399, 255, 0 ) );
        fill( red, green, 0 );
        rect( x, y, 150, 50 );
    }
}
```

Interpolate one forward and the other one backwards

**All-Green morphs into All-Red**
Drawing Circles and Other Regular Polygons, II
There is also no reason we can’t gradually change the radius …

```javascript
function Spiral( xc, yc, r1, r2, numsegs, numturns )
{
    let dang = numturns * (2.*PI) / float( numsegs );
    let ang = 0.;
    beginShape( );

    for( let i = 0; i <= numsegs; i = i + 1 )
    {
        let newrad = map( i, 0, numsegs, r1, r2 );
        let x = xc + newrad * cos(ang);
        let y = yc + newrad * sin(ang);
        vertex( x, y );
        ang = ang + dang;
    }

    endShape( );
}
```
function draw() {
    strokeWeight(5);
    noFill();
    Spiral(300, 300, 20, 200, 1000, 10);
}

There is also no reason we can’t gradually change the radius …
We Can Also Use This Same Idea to Arrange Things in a Circle

function draw( )
{
   let numobjects = 10;
   let radius = 200.;
   let xc = 300;
   let yc = 300;
   let numsegs = 20;
   let r = 50;
   let dang = (2.*PI) / float(numobjects - 1);
   let ang = 0.;
   for( let i = 0; i < numobjects; i = i + 1 )
   {
      let x = xc + radius * cos(ang);
      let y = yc + radius * sin(ang);
      let red = int(map(i, 0, numobjects - 1, 0, 255));
      let blue = int(map(i, 0, numobjects - 1, 255, 0));
      fill(red, 0, blue);
      Shape(x, y, r, numsegs);
      ang = ang + dang;
   }
}
Polar Equations
function Polar(xc, yc, factor, numsegs, numturns)
{
    let dang = numturns * (2.*PI) / float(numsegs);
    let theta = 0.;
    beginShape( );

    for( let i = 0; i <= numsegs; i = i + 1 )
    {
        let r = 200. * sin(factor*theta);
        let x = xc + r * cos(theta);
        let y = yc + r * sin(theta);
        vertex( x, y );
        theta = theta + dang;
    }

    endShape( );
}
function draw( )
{
    stroke( 50, 50, 255 );
    strokeWeight( 5 );
    noFill( );
    Polar( 300, 300, 4, 1000, 8 );
}

Setting the radius as a function of the angle

It’s a lot of fun to experiment with different values for the **factor** variable!
It’s a lot of fun to experiment with different values for the *factor* variable!

factor = 3

factor = 4

factor = 5

factor = 6

factor = 7

factor = 8
Randomness
Randomness

The Processing function `random()` takes in two numbers and returns a random number between them. Here it is being used to randomly position and size shapes:

```javascript
function setup( )
{
  createCanvas( 300, 300 );
  background( 200, 200, 255 );
  stroke( 0, 0, 0 );
  fill( 255, 50, 50 );
  noLoop( );
}

function draw( )
{
  for( let i = 0 ; i < 20 ; i = i + 1 )
  {
    let x = random( 0, 300 );
    let y = random( 0, 300 );
    let sizex = random( 10, 70 );
    let sizey = random( 10, 70 );
    rect( x, y, sizex, sizey );
  }
}  ```
Randomness

Or, also use it to pick colors:

```javascript
function draw() {
  for (let i = 0; i < 20; i = i + 1) {
    let x = random(0, 300);
    let y = random(0, 300);
    let sizex = random(10, 70);
    let sizey = random(10, 70);
    let r = random(50, 255);
    let g = random(50, 255);
    let b = random(50, 255);
    fill(r, g, b);
    rect(x, y, sizex, sizey);
  }
}
```
The Flower Garden
function setup( )
{
    createCanvas( 600, 600 );
    background( 200, 200, 255 );
    stroke( 0, 0, 0 );
    noLoop( );
}

function draw( )
{
    for( let i = 0 ; i < 200 ; i = i + 1 )
    {
        let r = random( 50, 255 );
        let g = random( 50, 255 );
        let b = random( 50, 255 );
        let xc = random( 0, width );
        let yc = random( 0, height );
        let factor = random( 3, 12 );
        let size = random( 5, 40 );
        fill( r, g, b );
        Flower( xc, yc, factor, size, 150, 1 );
    }
}

function Flower(xc, yc, factor, size, numsegs, numturns )
{
    let dang = numturns * (2.*PI) / float( numsegs );
    let theta = 0.;
    beginShape( );
    for( let i = 0; i <= numsegs; i = i + 1 )
    {
        let r = size * sin(factor*theta);
        let x = xc + r * cos(theta);
        let y = yc + r * sin(theta);
        vertex( x, y );
        theta = theta + dang;
    }
    endShape( );
}
The Program Randomly Chooses the Flower’s Color, Position, Size, and Number of Petals
You Get a Different Garden Every Time You Run the Program!
Drawing Text

ABC
DEF
Setting the size and drawing the text

```javascript
function setup( )
{
    createCanvas( 400, 400 );
    background( 200, 200, 255 );
}

function draw( )
{
    fill( 0, 0, 0 );
    textSize( 20 );
    text( "ABC", 50, 50 );

    fill( 0, 0, 255 );
    textSize( 30 );
    text( "DEF", 50, 100 );
}
```

- Text height in pixels
- Use `fill( )` to set the text color
- Text to draw
- Where `(x,y)` to draw the text
Saving Your Processing Program and Getting It Back Later
It saves to the cloud. But it only does it if you have an account.

Fortunately, AWSEM / STEM Academy already has one. So, go to the upper-right corner of your Processing window and click on Log in. Then enter:

Username: awsem
Password: corvallis72542

You can create your own account if you want, but only do it with your parents’ help.
Saving Your Processing Program and Getting It Back Later

The next trick is to click here and change the goofy name it gave your program to something more sensible, preferably something with your name in it and maybe something about what you were working on.
Saving Your Processing Program and Getting It Back Later

Then click **File → Save**
Getting Your Processing Programs Back Later

To bring back programs, click File → Open, look at the list of program names there, then click on the one you want to bring back.

The two I put there are *FlowerGarden* and *PaintProgram*.
if-statements
Your Code Often Wants to Test Something and Make a Decision Based On It

```cpp
if( condition )
{
    do this;
    do that;
}
```

These Operators Are the Possible Conditions to Test For:

- `<`  Is less than
- `<=` Is less than or equal to
- `>`  Is greater than
- `>=` Is greater than or equal to
- `==` Is equal to
- `!=` Is not equal to
- `&&` And
- `||` Or
function draw( )
{
    let x = 100;
    fill( 0, 255, 0 );
    for( let y = 0 ; y <= 500 ; y = y + 100 )
    {
        if( y >= 200 )
        {
            fill( 255, 0, 0 );
        }
        rect( x, y, 200, 50 );
    }
}
Your Code Often Wants to Test Something and Make a Decision Based On It or the Opposite Condition

```c
if( condition )
{
    do this1;
    do this2;
}
else
{
    do that1;
    do that2;
}
```
Your Code Often Wants to Test Something and Make a Decision Based On It or on Other Conditions

```cpp
if( condition )
{
    do this;
}
else if( another_condition )
{
    do it;
}
else
{
    do that;
}
```
Your Code Often Wants to Test Something and Make a Decision Based On It or Lots of Alternatives

`key` is a Processing built-in variable that tells you what key has been hit on the keyboard.

```java
if( key == 'r' )
{
    fill( 255, 50, 50 );
}
else if( key == 'g' )
{
    fill( 50, 255, 50 );
}
else if( key == 'b' )
{
    fill( 50, 50, 255 );
}
else
{
    fill( 100, 100, 100 );
}
```
Your Code Often Wants to Test Something and Make a Decision Based On It or Lots of Alternatives -- a Better Way

switch( key )
{
    case 'r':
        fill( 255, 50, 50 );
        break;

    case 'g':
        fill( 50, 255, 50 );
        break;

    case 'b':
        fill( 50, 50, 255 );
        break;

    default:
        fill( 100, 100, 100 );
}

Some of Processing’s Variables Already Have the Condition Built-In

```plaintext
function setup( )
{
    createCanvas( 600, 600 );
    background( 200, 200, 255 );
    stroke( 0, 0, 0 );
    fill( 255, 255, 0 );
}

function draw( )
{
    if( mouseIsPressed )
    {
        rect( mouseX, mouseY, 50, 20 );
    }
}
```

*mousedPressed* is a built-in variable that is always telling you if a mouse button is currently pressed.

*mouseX* and *mouseY* are built-in variables that are always telling you where the mouse cursor is.
Reacting to the Mouse and Keyboard: Creating Your Own Paint Program
function setup( )
{
  createCanvas( 600, 600 );
  background( 200, 200, 255 );
  stroke( 0, 0, 0 );
  fill( 255, 255, 0 );
}

function draw( )
{
  if( mouselsPressed )
  {
    ellipse( mouseX, mouseY, 50, 50 );
  }
}

*mouselsPressed* is a built-in variable that is always telling you if a mouse button is currently pressed.

*mouseX* and *mouseY* are built-in variables that are always telling you where the mouse cursor is.
The `mouselsPressed, mouseX, and mouseY` Variables
The `isKeyPressed` and `key` Variables

```java
function draw( )
{
    if( keyIsPressed )
    {
        switch( key )
        {
            case 'r':
                fill( 255, 50, 50 );
                break;
            case 'g':
                fill( 50, 255, 50 );
                break;
            case 'b':
                fill( 50, 50, 255 );
                break;
        }
    }
    if( mouseIsPressed )
    {
        ellipse( mouseX, mouseY, 50, 50 );
    }
}
```

- `keyIsPressed` is a built-in variable that is always telling you if a keyboard key has been pressed.
- `key` is a built-in variable that tells you what key has been hit on the keyboard.
- The `switch/case` statements are Processing’s way of checking many values without having a whole slew of if-statements.
- `mouseIsPressed` is a built-in variable that is always telling you if a mouse button has been pressed.
What if you want to read the Special Keys?

```java
... if( keyIsPressed )
{
    if( key == CODED )
    {
        switch( keyCode )
        {
            case UP: // up-arrow
                ...
                break;
        }
    }
}
```

Values for `keyCode` can be:
- UP
- DOWN
- LEFT
- RIGHT
- ESC
- DELETE
- BACKSPACE
- TAB
- ENTER
- RETURN
Transformations
function setup( )
{
    createCanvas( 800, 800 );
    background( 200, 200, 200 );
    stroke( 0, 0, 0 );
    fill( 0, 255, 255 );
}

function draw( )
{
    rect( 0, 0, 100, 50 );
}
function setup( ) {
    createCanvas( 800, 800 );
    background( 200, 200, 200 );
    stroke( 0, 0, 0 );
    fill( 0, 255, 255 );
}

function draw( ) {
    translate( 100, 200 );
    rect( 0, 0, 100, 50 );
}
Rotations and Scaling Happen Around the Origin
function draw()
{
    rotate( radians(45) );
    rect( 0, 0, 100, 50 );
}

In math, science, and computer programming, angles are not given in degrees, they are given in radians.

1 radian = 0.01745 degrees
1 radian = \( \pi/180 \) degrees

But, don’t worry about this.

Processing gives you a function, radians(), to automatically convert degrees into radians, like this:
    rad = radians( deg );

Use it!
Scaling

function draw()
{
    scale( 5., 1. );
    rect( 0, 0, 100, 50 );
}

Preview
function draw() {
  shearX( radians(45.) );
  rect( 0, 0, 100, 50 );
}

There is also a **shearY** transformation function.
Transformations Accumulate!

```
function draw() {
  rotate( radians( 10. ) );
  rotate( radians( 10. ) );
  ...
}
```

is the same as:

```
function draw() {
  rotate( radians( 20. ) );
  ...
}
```
Transformation Order Matters!

function draw( )
{
2. translate( 200, 300 );
1. rotate( radians(60.) );
    rect( 0, 0, 100, 50 );
}

2.
1.
function
draw( )
{
    translate( 200, 300 );
    push();
    shearX( radians(45.) );
    rect( 0, 0, 200, 100 );
    pop();
    fill( 255, 0, 0 );
    rotate( radians(-45.) );
    rect( 0, 0, 200, 100 );
}

You Can Save and Restore Transformations

1. save
2. restore
Transformations and for-loops

```javascript
function draw()
{
    translate(200, 300);

    for (let degrees = 0; degrees <= 360; degrees = degrees + 36)
    {
        push();
        rotate(radians(degrees));
        rect(0, 0, 100, 30);
        pop();
    }
}
```
Transformations and for-loops

```javascript
function draw() {
    translate(200, 300);

    for(let degrees = 0; degrees <= 360; degrees = degrees + 36) {
        push();
        rotate(radians(degrees));
        rect(0, -15, 100, 30);
        pop();
    }
}
```
What’s the Difference?

push();
    rotate(_radians(degrees));
    rect( 0, 0, 100, 30 );
    pop();

push();
    rotate(_radians(degrees));
    rect( 0, -15, 100, 30 );
    pop();
Transformations and for-loops

```javascript
function draw() {
    translate(200, 300);

    for(let degrees = 0; degrees <= 360; degrees = degrees + 36) {
        push();
        rotate(radians(degrees));
        rect(100, -15, 100, 30);
        pop();
    }
}
```
function draw() {
  translate(200, 300);
  for( let degrees = 0 ; degrees <= 360 ; degrees = degrees + 10 ) {
    push();
    let blue = map(degrees, 0, 360, 255, 0);
    fill(0, 255, blue);
    rotate(radians(degrees));
    let xsize = map(degrees, 0, 360, 100, 10);
    let ysize = map(degrees, 0, 360, 30, 5);
    rect(100, -15, xsize, ysize);
    pop();
  }
}
Images in *Processing* Programming
Let’s Start with a Favorite Image

It can be in .jpg, .bmp, or .png format

Each pixel contains a red-green-blue, each in the range 0-255

The image has an aspect ratio, which is the ratio of the number of Y pixels : the number of X pixels
(this image’s aspect ratio is 1:1)
Loading Your Image into Your Program’s assets Area

Step #1: Click on this arrow

Step #2: Click on this arrow and select **Create folder**

Step #3: Enter **assets** as the name of the folder and click on **Add Folder**

If you already have an **assets** folder, then you can skip steps #2 and #3.
Loading Your Image into Your Program’s Assets Area

**Step #4:** Hover over the word `assets` and then click on this arrow

**Step #5:** Click on *Upload file*

**Step #6:** Drag your image file into this window or click on this window to browse to the image file
let MyImage;

function setup( ) {
    createCanvas( 800, 800 );
    MyImage = loadImage( "assets/zelda.jpg" );
    background( 200, 200, 200 );
    stroke( 0, 0, 0 );
    fill( 255, 50, 50 );
}

function draw( ) {
    image( MyImage, 100, 100, 400, 400 );
}
let MyImage;

function setup( ) {
createCanvas( 800, 800 );
MyImage = loadImage( "assets/zelda.jpg" );
background( 200, 200, 200 );
stroke( 0, 0, 0 );
fill( 255, 50, 50 );
}

function draw( ) {
image( MyImage, 100, 100, 400, 400 );
}
What Happens if You Ask For a Different Aspect Ratio?

```javascript
function draw( )
{
    image( MyImage, 100, 100, 400, 200 );
}
```
function draw( )
{
    for( let i = 0 ; i < 6 ; i = i + 1 )
    {
        push( );
        translate( i*100, i*100 );
        image( MyImage, 0, 0, 200, 200 );
        pop( );
    }
}

Notice how transforming images works just like transforming rectangles does!
Rotating an Image

function draw( )
{
    for( let i = 0 ; i < 6 ; i = i + 1 )
    {
        push( );
        2. translate( 300, 300 );
        1. rotate( radians(i*60) );
        image( MyImage, 0, 0, 200, 200 );
        pop( );
    }
}

Notice how transforming images works just like transforming rectangles does!
Advanced Polar Patterns
Some Other Polar Patterns

\[ r = \sin \theta + \sin^3 \left( \frac{5\theta}{2} \right) \]

Note: \( x^3 = x \times x \times x \)

\[ r = \sin \left( \frac{8\theta}{5} \right) \]

Imitating a Spirograph™

Looks like an Oreo, but it’s not. 😊
Imitating a Spirograph™
let BigR = 200.;
let SmallR = 150.;
let D = 120.;

function setup( )
{
    createCanvas( 800, 800 );
    background( 200, 200, 255 );
    stroke( 0, 0, 0 );
    strokeWeight( 2 );
    noFill( );
}
function draw() {
    translate( 400, 400 );

    beginShape( );

    for( let t = 0; t <= 10*360; t = t + 2 )
    {
        let bigTheta = radians( t );
        let smallTheta = - ( BigR / SmallR ) * bigTheta;
        let x = ( BigR - SmallR ) * cos( bigTheta ) + D * cos( smallTheta );
        let y = ( BigR - SmallR ) * sin( bigTheta ) + D * sin( smallTheta );
        vertex( x, y );
    }

    endShape( );
}
