Why Do We Have These Notes?

Processing has thousands of "buttons" you can press. These notes are here to show you what certain combinations of buttons do in order to learn them the first time, and to remind you later when you’ve forgotten.

http://xkcd.com

Programming Through the Ages

A "program" is a set of instructions that you can store and playback later. This sounds like a computer-thing, but the idea of a "program" has been around for hundreds of years.

The earliest known "program" is (apparently) a mechanical music playback device developed in Baghdad in the 9th century. [https://en.wikipedia.org/wiki/Music_box](https://en.wikipedia.org/wiki/Music_box) You can find a similar device in Oregon today…
Music Box Programming
... at the Albany (Oregon) Carousel and Museum

Another Historic Example is Textile Programming

Jacquard Loom, circa 1804
And, of course, there is the Ever-fun Player Piano

Computers Eventually Imitated Historic Methods using Punch Cards

The Processing Programming Language

Where to Find Processing

In your favorite web browser, go to: https://p5js.org/

Here’s what you will see:

Go here to start using Processing

These are good links to check out!

Processing includes a collection of spectacular example programs
Click on the Editor link, or navigate to: https://editor.p5js.org/
Either way, here’s what you will see:

Running Processing

Here’s what you will get
Don’t worry – it will get better 😊
Introduction to Writing Processing Programs

With Processing, you get to do real-world programming that gives you visual output. You get to make cool pictures at the same time you are learning to program. This opens up a world of opportunities for you!

First, Remember How Graph Paper Works

The Greek letter delta, \( \Delta \), is the mathematics symbol for "the change in"

This is the “Graph Paper” System for Processing Programs

Colors for Computer Graphics Monitors: Additive Colors (RGB)

Colors are formed with combinations of **red**, **green**, and **blue**.

The smallest number you can use for each is 0
The largest number you can use for each is 255

<table>
<thead>
<tr>
<th>Color</th>
<th>Red</th>
<th>Green</th>
<th>Blue</th>
</tr>
</thead>
<tbody>
<tr>
<td>Black</td>
<td>0</td>
<td>0</td>
<td>0</td>

Yes, Our Vision System Really Does Mash Red and Green Together to Make Yellow!

Colors for Paints, Toners, and Clear Plastic: Subtractive Colors (CMYK)

- Green = Cyan + Yellow
- Yellow = Red + Green
- Cyan = Blue + Magenta

Subtractive Colors (CMYK)

- R = Red
- G = Green
- B = Blue
- W = White
- C = Cyan
- M = Magenta
- Y = Yellow
- K = Black
Writing a Processing Program – Try This!

```java
function setup( )
{
createCanvas( 800, 600 );
background( 200, 200, 255 );
stroke( 0, 0, 0 );
fill( 255, 50, 50 );
}

function draw( )
{
rect( 100, 200, 150, 50 );
}
```

You must add code to the `setup( )` function. Processing calls this **once** when your program starts.

You must add code to the `draw( )` function. Processing calls this **every time** it wants to re-draw the scene.

Running Your Processing Programs

<td>Screen height in pixels</td>
</tr>
<tr>
<td>fill()</td>
<td>Screen height in pixels</td>
</tr>
<tr>
<td>fill()</td>
<td>Screen height in pixels</td>
</tr>
</tbody>
</table>
Variables

Variables are the process of replacing numbers with symbols in order to generalize a computation to work in more than one situation.

```javascript
function draw() {
    let x = 100;
    let y = 2*x;
    rect(x, y, 150, 50);
}
```

“let” just says that you are defining a variable.

```
function draw() {
    let x = 100;
    let y = 200;
    rect(x, y, 150, 50);
}
```

We can use variables to create relationships.

When you assign a number to `x`, then `y` will automatically be twice as big as whatever you set `x` to be.

```
function draw() {
    let x = 100;
    let y = 2*x;
    rect(x, y, 150, 50);
}
```

```
function draw() {
    let x = 100;
    let y = 2*x;
    rect(x, y, 150, 50);
}
```

Drawing Lines and Polygons

Arithmetic operations in programming are:

- Addition
- Subtraction
- Multiplication
- Division
- Grouping
Rectangles are Fun, but Arbitrary Lines and Polygons are Funner

Easy – just list the coordinates:

beginShape( );
    vertex( x0, y0 );
    vertex( x1, y1 );
    vertex( x2, y2 );
    ... 
endShape( );

function draw( )
{
    beginShape( );
        vertex( 100, 100 );
        vertex( 100, 400 );
        vertex( 200, 400 );
        vertex( 300, 300 );
        vertex( 400,  50 );
    endShape( );
}

Drawing One Rectangle is Pretty Straightforward

rect( 100, 200, 150, 50 );
But, This Gets Awfully Boring if You Want to Draw 100 Rectangles!

```javascript
rect( 100, 200, 150, 50 );
rect( 110, 210, 150, 50 );
rect( 120, 220, 150, 50 );
```

for-loops to the Rescue!

Repeating a code pattern is a common theme in programming. This line is called a "for-loop". It is very handy for repeating patterns of code.

```javascript
function draw( )
{
  for( let x = 0 ; x < 400 ; x = x + 10 )
  {
    let y = x;
    rect( x, y, 150, 50 );
  }
}
```

The for-loop executes the commands in the curly braces a bunch of times. Using it looks like this:

1. Do this equation once at the start
2. Keep looping as long as this test is true
3. Do this at the end of one loop, but before the start of the next one

```
for( let x = 0 ; x < 400 ; x = x + 10 )
```

Yes, the semi-colons (;) are necessary!

Drawing Circles and Other Regular Polygons, I
First, We Need to Understand Something about Angles

If a circle has a radius of 1.0, then we can march around it by simply changing the angle that we call \( \theta \).

One of the things we notice is that each angle \( \theta \) has a unique \( X \) and \( Y \) that goes with it.

The \( X \) and \( Y \) are different for each \( \theta \).

Centuries ago, people developed tables of those \( X \) and \( Y \) values as functions of \( \theta \). They called the \( X \) values \textit{cosines} and the \( Y \) values \textit{sines}. These are abbreviated \text{cos} and \text{sin}.

In Earlier Times, People Looked up Sines and Cosines in Books and on Slide Rules – Fortunately We Now Have Calculators and Computers
Cosines and Sines are Really Ratios

If we were to double the radius of the circle, all of the X’s and Y’s would also double.

So, really the cos and sin are ratios of X and Y to the circle Radius.

\[
\cos \theta = \frac{X}{R} \\
\sin \theta = \frac{Y}{R}
\]

So, if we know the circle Radius, and we march through a series of \( \theta \) angles, we can determine all of the X’s and Y’s that we need to draw a circle.

\[
X = R \times \cos \theta \\
Y = R \times \sin \theta
\]

Function

```javascript
function Shape(xc, yc, r, numsegs) {
    let dang = (2.*PI) / numsegs;
    let ang = 0;
    beginShape( );
    for( let i = 0; i <= numsegs; i = i + 1 ) {
        let x = xc + r * cos(ang);
        let y = yc + r * sin(ang);
        vertex( x, y );
        ang = ang + dang;
    }
    endShape( );
}
```

Processing Doesn’t Include Regular Polygon-Drawing Functions, So We Add Our Own to the End of the Program

`numsegs` is the number of line segments making up the circumference of the circle.

`numsegs=36` gives a nice circle.

5 gives a pentagon.

8 gives an octagon.

4 gives you a square. Etc.

We commonly measure angles in degrees, but scientists, engineers, and computers like to measure angles in something else called radians.

There are 360° (degrees) in a complete circle.

There are 2\( \pi \) (~6.28) radians in a complete circle.

The built-in `cos( )` and `sin( )` functions expect angles to be given in radians.

Processing has built-in functions to convert between the two:

```javascript
let rad = radians( deg );
let deg = degrees( rad );
```
function draw() {
  fill(255, 50, 50);
  Shape(200, 200, 100);
  fill(50, 255, 50);
  Shape(300, 300, 100);
  fill(50, 50, 255);
  Shape(400, 400, 100);
}

Circles, Pentagons, and Octagons -- oh my!

And, there is no reason the X and Y radii need to be the same...

function draw() {
  fill(255, 50, 50);
  Shape2(200, 200, 150, 75, 36);
  fill(50, 255, 50);
  Shape2(300, 300, 150, 75, 5);
  fill(50, 50, 255);
  Shape2(400, 400, 150, 75, 8);
}

The Processing `map()` Function
This function takes an input value, the range of values it lives between, and the range of output values. It returns the output value that corresponds to the input value.

So, for example, if we wanted to turn an $x$ value into a red color, we might say:

```javascript
let red = int( map( x, 0, 399, 0, 255 ) );
```

### More Sophisticated Relationships:

The `map()` function can also do blending.

```javascript
function draw( )
{
    for( let x = 0 ; x < 400 ; x = x + 10 )
    {
        let y = x;
        let red = int( map( x, 0, 399, 0, 255 ) );
        let green = int( map( y, 0, 399, 0, 255 ) );
        let green = 3 * green / 4;
        fill( red, green, 0 );
        rect( x, y, 150, 50 );
    }
}
```

Interpolate one forward and the other one backwards.
There is also no reason we can't gradually change the radius …

```javascript
function Spiral( xc, yc, r1, r2, numsegs, numturns ) {
    let dang = numturns * (2.*PI) / float( numsegs );
    let ang = 0.;
    beginShape( );
    for( let i = 0; i <= numsegs; i = i + 1 )
    {
        let newrad = map( i,   0, numsegs,  r1, r2 );
        let x = xc + newrad * cos(ang);
        let y = yc + newrad * sin(ang);
        vertex( x, y );
        ang = ang + dang;
    }
    endShape( );
}
```

We Can Also Use This Same Idea to Arrange Things in a Circle

```javascript
function draw( ) {
    let numobjects = 10;
    let radius = 200.;
    let xc = 300;
    let yc = 300;
    let numsegs = 20;
    let r = 50;
    let dang = (2.*PI) / float( numobjects - 1 );
    let ang = 0.;
    for( let i = 0; i < numobjects; i = i + 1 )
    {
        let x = xc + radius * cos(ang);
        let y = yc + radius * sin(ang);
        let red   = int( map( i,   0, numobjects - 1,     0, 255 ) );
        let blue = int( map( i,   0, numobjects - 1, 255,     0 ) );
        fill( red, 0, blue );
        Shape( x, y, r, numsegs );
        ang = ang + dang;
    }
}
```
### Polar Equations

```javascript
function Polar(xc, yc, factor, numsegs, numturns )
{
    let dang = numturns * (2.*PI) / float( numsegs );
    let theta = 0.;
    beginShape( );
    for( let i = 0; i <= numsegs; i = i + 1 )
    {
        let r = 200. * sin(factor*theta);
        let x = xc + r * cos(theta);
        let y = yc + r * sin(theta);
        vertex( x, y );
        theta = theta + dang;
    }
    endShape( );
}
```

Setting the radius as a function of the angle

200 is the radius of the circle the shape fits in

- **factor = 3**
- **factor = 4**
- **factor = 5**
- **factor = 6**
- **factor = 7**
- **factor = 8**

It's a lot of fun to experiment with different values for the `factor` variable!
Randomness

The Processing function `random()` takes in two numbers and returns a random number between them. Here it is being used to randomly position and size shapes:

```javascript
function setup() {
  createCanvas(300, 300);
  stroke(0, 0, 0);
  fill(255, 50, 50);
  noLoop();
}

function draw() {
  for (let i = 0; i < 20; i++) {
    let x = random(0, 300);
    let y = random(0, 300);
    let sizex = random(10, 70);
    let sizey = random(10, 70);
    rect(x, y, sizex, sizey);
  }
}
```

Randomness

Or, also use it to pick colors:

```javascript
function draw() {
  for (let i = 0; i < 20; i++) {
    let x = random(0, 300);
    let y = random(0, 300);
    let sizex = random(10, 70);
    let sizey = random(10, 70);
    let r = random(50, 255);
    let g = random(50, 255);
    let b = random(50, 255);
    fill(r, g, b);
    rect(x, y, sizex, sizey);
  }
}
```

Randomness

Drawing Text

```text
ABC
DEF
```
Setting the size and drawing the text

```javascript
function setup() {
    createCanvas(400, 400);
    background(200, 200, 255);
}

function draw() {
    fill(0, 0, 0);
    textSize(20);
    text("ABC", 50, 50);
    fill(0, 0, 255);
    textSize(30);
    text("DEF", 50, 100);
}
```

Text height in pixels
Text to draw
Use fill() to set the text color
Where (x, y) to draw the text
Text size

Saving Your Processing Program and Getting It Back Later

It saves to the cloud. But it only does it if you have an account.
Fortunately, AWSEM/STEM Academy already has one.
So, go to the upper-right corner of your Processing window and click on Log in.
Then enter:

Username: awsem
Password: corvallis72542

You can create your own account if you want, **but only do it with your parents’ help.**
Saving Your Processing Program and Getting It Back Later

Then click File → Save

Getting Your Processing Programs Back Later

To bring back programs, click File → Open, look at the list of program names there, then click on the one you want to bring back

The two I put there are FlowerGarden and PaintProgram.

The Flower Garden

Be sure the call to noLoop() is included in setup()!

function setup() {
  createCanvas(600, 600);
  background(200, 200, 255);
  stroke(0, 0, 0);
  noLoop();
}

function draw() {
  for (let i = 0; i < 200; i = i + 1) {
    let r = random(50, 255);
    let g = random(50, 255);
    let b = random(50, 255);
    let xc = random(0, width);
    let yc = random(0, height);
    let factor = random(3, 12);
    let size = random(5, 40);
    fill(r, g, b);
    Flower(xc, yc, factor, size, 150, 1);
  }
}

function Flower(xc, yc, factor, size, numsegs, numturns) {
  let dang = numturns * (2.*PI) / float(numsegs);
  let theta = 0.;
  beginShape();
  for (let i = 0; i <= numsegs; i = i + 1) {
    let r = size * sin(factor*theta);
    let x = xc + r * cos(theta);
    let y = yc + r * sin(theta);
    vertex(x, y);
    theta = theta + dang;
  }
  endShape();
}
The Program Randomly Chooses the Flower’s Color, Position, Size, and Number of Petals

You Get a Different Garden Every Time You Run the Program!

if-statements

Your Code Often Wants to Test Something and Make a Decision Based On It

These Operators Are the Possible Conditions to Test For:

- `<` Is less than
- `<=` Is less than or equal to
- `>` Is greater than
- `>=` Is greater than or equal to
- `==` Is equal to
- `!=` Is not equal to
- `&&` And
- `||` Or
Example

```javascript
function draw() {
  let x = 100;
  fill(0, 255, 0);
  for (let y = 0; y <= 500; y = y + 100) {
    if (y >= 200) {
      fill(255, 0, 0);
      rect(x, y, 200, 50);
    }
  }
}
```

Your Code Often Wants to Test Something and Make a Decision Based On It or the Opposite Condition

```javascript
if (condition) {
  do this1;
  do this2;
} else {
  do that1;
  do that2;
}
```

Your Code Often Wants to Test Something and Make a Decision Based On It or Other Conditions

```javascript
if (condition) {
  do this;
} else if (another_condition) {
  do it;
} else {
  do that;
}
```

Your Code Often Wants to Test Something and Make a Decision Based On It or Lots of Alternatives

```javascript
if (key == 'r') {
  fill(255, 50, 50);
} else if (key == 'g') {
  fill(50, 255, 50);
} else if (key == 'b') {
  fill(50, 50, 255);
} else {
  fill(100, 100, 100);
}
```

`key` is a Processing built-in variable that tells you what key has been hit on the keyboard.
Your Code Often Wants to Test Something and Make a Decision Based On It or Lots of Alternatives -- a Better Way

```
switch( key ) {
    case 'r':
        fill( 255, 50, 50 );
        break;
    case 'g':
        fill( 50, 255, 50 );
        break;
    case 'b':
        fill( 50, 50, 255 );
        break;
    default:
        fill( 100, 100, 100 );
}
```

Some of Processing's Variables Already Have the Condition Built-In

```
function setup( ) {
    createCanvas( 600, 600 );
    background( 200, 200, 255 );
    stroke( 0, 0, 0 );
    fill( 255, 255, 0 );
}
```

```
function draw( ) {
    if( mouseIsPressed ) {
        rect( mouseX, mouseY, 50, 20 );
    }
}
```

The `mouseIsPressed`, `mouseX`, and `mouseY` Variables

```
function setup( ) {
    createCanvas( 600, 600 );
    background( 200, 200, 255 );
    stroke( 0, 0, 0 );
    fill( 255, 255, 0 );
}
```

```
function draw( ) {
    if( mouseIsPressed ) {
        ellipse( mouseX, mouseY, 50, 50 );
    }
}
```

Reacting to the Mouse and Keyboard: Creating Your Own Paint Program
The `mouseIsPressed`, `mouseX`, and `mouseY` Variables

function `draw()` {
    if (keyIsPressed) {
        switch (key) {
            case 'r':
                fill (255, 50, 50);
                break;
            case 'g':
                fill (50, 255, 50);
                break;
            case 'b':
                fill (50, 50, 255);
                break;
        }
    }
    if (mouseIsPressed) {
        ellipse (mouseX, mouseY, 50, 50);
    }
}

The `isKeyPressed` and `key` Variables

`keyIsPressed` is a built-in variable that is always telling you if a keyboard key has been pressed.

`key` is a built-in variable that tells you what key has been hit on the keyboard.

The `switch/case` statements are Processing’s way of checking many values without having a whole slew of if-statements.

`mouseIsPressed` is a built-in variable that is always telling you if a mouse button has been pressed.

What if you want to read the Special Keys?

... if (keyIsPressed) {
    if (key == CODED) {
        switch (keyCode) {
            case UP: // up-arrow
                . . .
                break;
            . . .
        }
    }
}

Values for `keyCode` can be:
- UP
- DOWN
- LEFT
- RIGHT
- ESC
- DELETE
- BACKSPACE
- TAB
- ENTER
- RETURN
Let's Use Our Rectangle Object as an Example of Transformations

```javascript
function setup() {
  createCanvas( 800, 800);
  background( 200, 200, 200);
  stroke( 0, 0, 0);
  fill(   0, 255, 255);
}

function draw() {
  rect(  0,  0,   100, 50);
}
```

It is Often Nice to Transform Entire Objects at Once

```javascript
function setup( ) {
  createCanvas( 800, 800 );
  background( 200, 200, 200 );
  stroke( 0, 0, 0 );
  fill(   0, 255, 255 );
}

function draw( ) {
  translate( 100, 200 );
  rect( 0, 0, 100, 50 );
}
```

The word "translate" means to "move around".

Rotations and Scaling Happen Around the Origin
In math, science, and computer programming, angles are not given in degrees, they are given in radians.

1 radian = 0.01745 degrees
1 radian = \pi/180. degrees
But, don’t worry about this.

Processing gives you a function, `radians()`, to automatically convert degrees into radians, like this:

```
rad = radians( deg );
```

Use it!

There is also a `shearY` transformation function

is the same as:

```
function draw() 
{ 
    rotate( radians( 20. ) );
    ...
}
```
Function `draw`:
```javascript
function draw()
{
    translate(200, 300);
    rect(0, 0, 100, 50);
}
```

**Transformation Order Matters!**

Function `draw`:
```javascript
function draw()
{
    rotate(radians(60.));
    translate(200, 300);
    rect(0, 0, 100, 50);
}
```

1. Transformation Order Matters!

Function `draw`:
```javascript
function draw()
{
    translate(200, 300);
    push();
    shearX(radians(45.));
    rect(0, 0, 200, 100);
    pop();
    fill(255, 0, 0);
    rotate(radians(-45.));
    rect(0, 0, 200, 100);
}
```

You Can Save and Restore Transformations

Transformations and for-loops

Function `draw`:
```javascript
function draw()
{
    translate(200, 300);
    for(let degrees = 0; degrees <= 360; degrees = degrees + 36)
    {
        push();
        rotate(radians(degrees));
        rect(0, 0, 100, 30);
        pop();
    }
}
```

Transformations and for-loops

Function `draw`:
```javascript
function draw()
{
    translate(200, 300);
    for(let degrees = 0; degrees <= 360; degrees = degrees + 36)
    {
        push();
        rotate(radians(degrees));
        rect(0, -15, 100, 30);
        pop();
    }
}
```
What's the Difference?

function draw() {
    translate(200, 300);
    for(let degrees = 0 ; degrees <= 360 ; degrees = degrees + 36) {
        push();
        rotate(radians(degrees));
        rect(100, -15, 100, 30);
        pop();
    }
}

Transformations and for-loops

function draw() {
    translate(200, 300);
    for(let degrees = 0 ; degrees <= 360 ; degrees = degrees + 10) {
        push();
        rotate(radians(degrees));
        let xsize = map(degrees, 0, 360, 100, 10);
        let ysize = map(degrees, 0, 360, 30, 5);
        rect(100, -15, xsize, ysize);
        pop();
    }
}

Rotating While Changing Color and Size

Images in Processing Programming
Let's Start with a Favorite Image

It can be in .jpg, .bmp, or .png format.
Each pixel contains a red-green-blue, each in the range 0-255.
The image has an aspect ratio, which is the ratio of the number of Y pixels : the number of X pixels.
(this image’s aspect ratio is 1:1)

Loading Your Image into Your Program’s assets Area

Step #1: Click on this arrow

Step #2: Click on this arrow and select Create folder.

If you already have an assets folder, then you can skip steps #2 and #3.

Step #3: Enter assets as the name of the folder and click on Add Folder.

Step #4: Hover over the word assets and then click on this arrow.

Step #5: Click on Upload file.

Step #6: Drag your image file into this window or click on this window to browse to the image file.

Loading and Drawing an Image

let MyImage;
function setup( ) {
createCanvas( 800, 800 );
MyImage = loadImage("assets/zelda.jpg");
background( 200, 200, 200 );
stroke( 0, 0, 0 );
fill( 255, 50, 50 );
}
function draw( ) {
image( MyImage, 100, 100, 400, 400 );
}

Declaring a variable up here, ahead of everything else, makes it so that it can be seen from anywhere in the program.

This tells your program to look for the image in its assets area.

This loads the image from the assets area into the variable called MyImage.

This function draws the image from the variable called MyImage.

How many pixels to use to draw the image.

What X-Y to draw its upper-left corner at.
Loading and Drawing an Image

```javascript
let MyImage;

function setup( ) {
  createCanvas( 800, 800 );
  MyImage = loadImage("assets/zelda.jpg");
  background( 200, 200, 200 );
  stroke( 0, 0, 0 );
  fill( 255, 50, 50 );
}

function draw( ) {
  image( MyImage, 100, 100, 400, 400 );
}
```

What Happens if You Ask For a Different Aspect Ratio?

```javascript
function draw( ) {
  image( MyImage, 100, 100, 400, 200 );
}
```

Translating an Image

```javascript
function draw( ) {
  for( let i = 0 ; i < 6 ; i = i + 1 ) {
    push( );
    translate(i*100, i*100);
    image( MyImage, 0, 0, 200, 200 );
    pop( );
  }
}
```

Rotating an Image

```javascript
function draw( ) {
  for( let i = 0 ; i < 6 ; i = i + 1 ) {
    push( );
    1. translate( 300, 300 );
    2. rotate( radians(90) );
    image( MyImage, 0, 0, 200, 200 );
    pop( );
  }
}
```

Notice how transforming images works just like transforming rectangles does!
Advanced Polar Patterns

$$r = \sin \theta + \sin^3 \left( \frac{5\theta}{2} \right)$$

Some Other Polar Patterns

Note: $x^3 = x \times x \times x$

$$r = \sin \left( \frac{8\theta}{5} \right)$$

Imitating a Spirograph™

Looks like an Oreo, but it's not. ©
let BigR = 200.;
let SmallR = 150.;
let D = 120.;

function setup() {
    createCanvas(800, 800);
    background(200, 200, 255);
    stroke(0, 0, 0);
    strokeWeight(2);
    noFill();
}

function draw() {
    translate(400, 400);
    beginShape();
    for(let t = 0; t <= 10*360; t = t + 2) {
        let bigTheta = radians(t);
        let smallTheta = - (BigR / SmallR) * bigTheta;
        let x = (BigR - SmallR) * cos(bigTheta) + D * cos(smallTheta);
        let y = (BigR - SmallR) * sin(bigTheta) + D * sin(smallTheta);
        vertex(x, y);
    }
    endShape();
}
