Name:

Find the polynomial P of degree ≤ 3 that interpolates the data (1,1), (2,1), (3,2), (0,-1). What is the value of P(1.5)?

$$(x_1, y_1) = (1, 1)$$
 $(\lambda_{21}, y_2) = (2, 1)$
 $(\lambda_{31}, y_3) = (3, 2)$
 $(\lambda_{41}, y_4) = (0, -1)$

$$L_{1}(x) = \frac{(x-x_{1})(x-x_{3})(x-x_{4})}{(x_{1}-x_{2})(x_{1}-x_{2})(x_{1}-x_{4})} = \frac{(x-2)(x-3)(x-0)}{(1-2)(1-3)(1-0)} = \frac{1}{2}x(x-2)(x-3).$$

$$\left| \frac{1}{2} (x) \right| = \frac{(\chi - \chi_1)(\chi - \chi_2)(\chi - \chi_2)}{(\chi_2 - \chi_1)(\chi_2 - \chi_2)(\chi_2 - \chi_2)} = \frac{(\chi - 1)(\chi - 3)(\chi - 0)}{(2 - 1)(2 - 3)(2 - 0)} = -\frac{1}{2} \chi (\chi - 1)(\chi - 3) + \frac{1}{2} \chi (\chi - 1)(\chi - 3) + \frac{1}{2} \chi (\chi - 1)(\chi - 3) + \frac{1}{2} \chi (\chi - 1)(\chi - 3)(\chi - 3) + \frac{1}{2} \chi (\chi - 1)(\chi - 3)(\chi - 3) + \frac{1}{2} \chi (\chi - 1)(\chi - 3)(\chi - 3)(\chi - 3)(\chi - 3) + \frac{1}{2} \chi (\chi - 1)(\chi - 3)(\chi - 3$$

$$l_{3}(12) = \frac{(x-x_{1})(x-x_{2})(x-x_{4})}{(x_{3}-x_{1})(x_{3}-x_{2})(x_{3}-x_{4})} = \frac{(x-1)(x-2)(x-6)}{(x-1)(3-2)(3-6)} = \frac{1}{6} x(x-1)(x-2).$$

$$L_{4}(x) = \frac{(x-x_{1})(x-x_{2})(x-x_{2})}{(x_{4}-x_{1})(x_{4}-x_{2})(x_{4}-x_{3})} = \frac{(x-1)(x-2)(x-3)}{(0-1)(0-2)(0-2)} = -\frac{1}{6}(x-1)(x-2)(x-3).$$

Then

$$P(x) = y_1 L_1(x) + y_2 L_2(x) + y_3 L_3(x) + y_4 L_4(x)$$

$$= 4(x) + L_2(x) + 2L_3(x) - L_4(x)$$

$$= \frac{1}{2} \times (x-2)(x-3) - \frac{1}{2} \times (x-1)(x-3) + \frac{1}{3} \times (x-1)(x-2) + \frac{1}{6} (x-1)(x-2)(x-3)$$

After expanding and simplifying, we get

$$\boxed{2(x) = \frac{1}{2}x^3 - \frac{5}{2}x^2 + 4x - 1}$$
