

Inductive Definitions with Inference Rules

Outline

Introduction

Specifying inductive definitions

- Inference rules in action

- Judgments, axioms, and rules

Reasoning about inductive definitions

- Direct proofs

- Admissibility

- Rule induction

What are inference rules?

Inference rules – a mathematical metalanguage

For **specifying** and **formally reasoning** about **inductive definitions**

Inductive definition

Recursively defines something in terms of itself

Outline

Reasoning about inductive definitions

Direct proofs

Admissibility

Rule induction

Other metalanguages for inductive definitions

Haskell data types

```
data Nat = Z | S Nat
data Exp = Add Exp Exp
         | Neg Exp
         | Lit Nat
```

Grammars

```
 $n \in Nat ::= \mathbf{Z} \mid \mathbf{S} \ n$ 
 $e \in Exp ::= \mathbf{add} \ e \ e$ 
           |  $\mathbf{neg} \ e$ 
           |  $n$ 
```

Recursive functions in Haskell

```
even :: Nat -> Bool
even Z          = True
even (S Z)      = False
even (S (S n)) = even n
```

Can also define all of these with
inference rules!

Example: defining syntax by inference rules

Grammars

$$n \in \text{Nat} ::= \mathbf{Z} \mid \mathbf{S} n$$
$$e \in \text{Exp} ::= \mathbf{add} e e$$
$$\mid \mathbf{neg} e$$
$$\mid n$$

rule schema

$$\mathbf{Z} \in \text{Nat}$$

$$\frac{n \in \text{Nat}}{\mathbf{S} n \in \text{Nat}}$$

axiom

(no premises)

$$\frac{n \in \text{Nat}}{n \in \text{Exp}}$$

$$\frac{e \in \text{Exp}}{\mathbf{neg} e \in \text{Exp}}$$

$$\frac{e_1 \in \text{Exp} \quad e_2 \in \text{Exp}}{\mathbf{add} e_1 e_2 \in \text{Exp}}$$

Example: defining a predicate

Recursive function in Haskell

```
even :: Nat -> Bool
even Z      = True
even (S Z)  = False
even (S (S n)) = even n
```

Option 1: Constructive judgment

$$\text{Even}(\mathbf{Z}) \quad \frac{\text{Even}(n)}{\text{Even}(\mathbf{S}(\mathbf{S}n))}$$

Option 2: Relate inputs to outputs

$$\text{Even}(\mathbf{Z}, \mathbf{true}) \quad \text{Even}(\mathbf{S} \mathbf{Z}, \mathbf{false})$$

$$\frac{\text{Even}(n, b)}{\text{Even}(\mathbf{S}(\mathbf{S}n), b)}$$

Rule induction

How to define a concept (in general)

Three parts of a definition:

1. **syntax** – how to express the concept
2. **type** – what kind of information is it?
3. **content** – the definition itself

Example: dictionary definition

Syntax: e·ven |'ēvən|
Type: adjective
Content: (of a number) divisible by two without a remainder

Example: function definition

```
even :: Nat -> Bool
even Z      = True
even (S Z)  = False
even (S (S n)) = even n
```

How to define a concept using inference rules

1. Define a **judgment form** – syntax and type

States that one or more values have some **property** or exist in some **relation** to each other

2. Write down the **rules** for the judgment – content

- **axioms** – base cases, only conclusion
- **proper rules** – recursive cases, premises + conclusion

Judgments

1. Define a **judgment form** – syntax and type

States that one or more values have some **property** or exist in some **relation** to each other

Syntax	Type	Property or relation
$n \in Nat$	AST	n is in the syntactic category Nat
$Even(n)$	Nat	n is an even number
$n_1 < n_2$	$Nat \times Nat$	n_1 is less than n_2
$e : T$	$Exp \times Type$	e has type T
$\Gamma \vdash e : T$	$Env \times Exp \times Type$	e has type T in environment Γ

Set theoretic view of judgments

A judgment is (conceptually) a **predicate** that indicates set membership

Example: $Even(n) \subseteq Nat$

$Even : Nat \rightarrow \mathbb{B}$

$= \{(Z, true), (SZ, false), (S(SZ), true), \dots\}$

$\equiv \{Z, S(SZ), S(S(S(SZ))), \dots\} \subseteq Nat$

Example: $n_1 < n_2 \subseteq Nat \times Nat$

$< : Nat \times Nat \rightarrow \mathbb{B}$

$= \{((0, 0), false), ((0, 1), true), \dots ((5, 3), false), \dots ((5, 7), true), \dots\}$

$\equiv \{(0, 1), \dots (5, 7), \dots\} \subseteq Nat \times Nat$

Giving meaning to a judgment by inference rules

2. Write down the **rules** of the judgment – content

- **axioms** – base cases, only conclusion
- **proper rules** – recursive cases, premises + conclusion

Inductively defines the **instances** of a judgment (i.e. members of its set)

Rules for: $Even(n) \subseteq Nat$

$$Even(\mathbf{Z}) \quad \frac{Even(n)}{Even(\mathbf{S} (\mathbf{S} n))}$$

Rules for: $n_1 < n_2 \subseteq Nat \times Nat$

$$\mathbf{Z} < \mathbf{S} \mathbf{Z} \quad \frac{n_1 < n_2}{n_1 < \mathbf{S} n_2} \quad \frac{n_1 < n_2}{\mathbf{S} n_1 < \mathbf{S} n_2}$$

Exercises

1. Define the judgment: $Odd(n) \subseteq Nat$
2. Define the judgment: $n_1 + n_2 = n_3 \subseteq Nat \times Nat \times Nat$

For reference:

Rules for: $Even(n) \subseteq Nat$

$$Even(\mathbf{Z}) \quad \frac{Even(n)}{Even(\mathbf{S}(\mathbf{S}n))}$$

Rules for: $n_1 < n_2 \subseteq Nat \times Nat$

$$\mathbf{Z} < \mathbf{S} \mathbf{Z} \quad \frac{n_1 < n_2}{n_1 < \mathbf{S} n_2} \quad \frac{n_1 < n_2}{\mathbf{S} n_1 < \mathbf{S} n_2}$$

Admissibility

Rule induction

Expressing claims

We can also use inference rules to express **claims** about judgments

Examples

$$\mathbf{S}(\mathbf{SZ}) \in \mathit{Nat}$$

$$\frac{\mathit{Even}(\mathbf{S}n)}{\mathit{Odd}(n)}$$

$$\frac{n_1 < n_2 \quad n_2 < n_3}{n_1 < n_3}$$

$$\frac{n_1 + n_2 = n_3}{n_2 + n_1 = n_3}$$

How can we **prove** these claims?

Three main techniques:

1. **direct proof** – derive conclusion from premises using the definition
2. **admissibility** – derive conclusion from derivations of premises
3. **rule induction** – reason inductively using the definition

Outline

Introduction

Specifying inductive definitions

Judgments, axioms, and rules

Reasoning about inductive definitions

Direct proofs

Admissibility

Rule induction

Direct proof by derivation

Definition: $n \in \text{Nat}$

$$\mathbf{z} \in \text{Nat} \quad \text{Succ} \frac{n \in \text{Nat}}{\mathbf{S} n \in \text{Nat}}$$

$$\begin{array}{l} \text{Succ} \frac{\mathbf{z} \in \text{Nat}}{\mathbf{S} \mathbf{z} \in \text{Nat}} \\ \text{Succ} \frac{\mathbf{S} \mathbf{z} \in \text{Nat}}{\mathbf{S} (\mathbf{S} \mathbf{z}) \in \text{Nat}} \end{array}$$

Definition: $n_1 < n_2 \subseteq \text{Nat} \times \text{Nat}$

$$\mathbf{z} < \mathbf{S} \mathbf{z} \quad \text{S} \frac{n_1 < n_2}{n_1 < \mathbf{S} n_2} \quad +1 \frac{n_1 < n_2}{\mathbf{S} n_1 < \mathbf{S} n_2}$$

$$\begin{array}{l} \text{S} \frac{\mathbf{z} < \mathbf{S} \mathbf{z}}{\mathbf{z} < \mathbf{S} (\mathbf{S} \mathbf{z})} \\ +1 \frac{\mathbf{z} < \mathbf{S} (\mathbf{S} \mathbf{z})}{\mathbf{S} \mathbf{z} < \mathbf{S} (\mathbf{S} (\mathbf{S} \mathbf{z}))} \end{array}$$

Proof trees

Definition: $e \in \text{Exp}$

Axioms: $\mathbf{0} \in \text{Nat}$, $\mathbf{1} \in \text{Nat}$, $\mathbf{2} \in \text{Nat}$, ...

$$\text{lit } \frac{n \in \text{Nat}}{n \in \text{Exp}} \quad \text{neg } \frac{e \in \text{Exp}}{\mathbf{neg } e \in \text{Exp}} \quad \text{add } \frac{e_1 \in \text{Exp} \quad e_2 \in \text{Exp}}{\mathbf{add } e_1 e_2 \in \text{Exp}}$$

$$\begin{array}{c} \text{lit } \frac{\mathbf{2} \in \text{Nat}}{\mathbf{2} \in \text{Exp}} \quad \text{lit } \frac{\mathbf{3} \in \text{Nat}}{\mathbf{3} \in \text{Exp}} \\ \text{add } \frac{\quad}{\mathbf{add } \mathbf{2} \mathbf{3} \in \text{Exp}} \quad \text{neg } \frac{\text{lit } \frac{\mathbf{4} \in \text{Nat}}{\mathbf{4} \in \text{Exp}}}{\mathbf{neg } \mathbf{4} \in \text{Exp}} \\ \text{add } \frac{\quad}{\mathbf{add } (\mathbf{add } \mathbf{2} \mathbf{3}) (\mathbf{neg } \mathbf{4}) \in \text{Exp}} \end{array}$$

Exercises

Prove that the following expressions are valid terms in Exp

1. **neg (add 5 (neg 2))**
2. **add (neg (neg 3)) 4**

Definition: $e \in Exp$

Axioms: $\mathbf{0} \in Nat$, $\mathbf{1} \in Nat$, $\mathbf{2} \in Nat$, ...

$$\text{lit } \frac{n \in Nat}{n \in Exp} \quad \text{neg } \frac{e \in Exp}{\mathbf{neg } e \in Exp} \quad \text{add } \frac{e_1 \in Exp \quad e_2 \in Exp}{\mathbf{add } e_1 e_2 \in Exp}$$

Outline

Introduction

Specifying inductive definitions

Inference rules in action

Judgments, axioms, and rules

Reasoning about inductive definitions

Direct proofs

Admissibility

Rule induction

Admissibility

Construct proofs from assumed **derivations of the premises**

Insights:

- If the premise of a claim is satisfied, it must have a derivation
- Can use information in the derivations to prove the conclusion

Proof technique

Show that **all possible derivations** of premises yield a proof of the conclusion

Apply definition rules backwards on the premises, prove for each case!

Super simple example

Definition: $n \in \text{Nat} \subseteq \text{AST}$

$$\mathbf{z} \in \text{Nat} \quad \text{Succ} \frac{n \in \text{Nat}}{\mathbf{S} n \in \text{Nat}}$$

Proof sketch:

- Enumerate derivations of premise
- Show that each derivation proves the conclusion

Bold claim

$$\frac{\mathbf{S} (\mathbf{S} n) \in \text{Nat}}{n \in \text{Nat}}$$

Only possible derivation

$$\text{Succ} \frac{n \in \text{Nat}}{\mathbf{S} n \in \text{Nat}}$$
$$\text{Succ} \frac{\mathbf{S} n \in \text{Nat}}{\mathbf{S} (\mathbf{S} n) \in \text{Nat}}$$

Inference rules in action

Judgments, axioms, and rules

Reasoning about inductive definitions

Direct proofs

Admissibility

Rule induction

Rule induction

Just like structural induction on inductive data types!

Definition: $e \in \text{Exp} \subseteq \text{AST}$

$$\frac{n \in \text{Nat}}{n \in \text{Exp}}$$

$$\frac{e \in \text{Exp}}{\mathbf{neg} \ e \in \text{Exp}}$$

$$\frac{e_1 \in \text{Exp} \quad e_2 \in \text{Exp}}{\mathbf{add} \ e_1 \ e_2 \in \text{Exp}}$$

Suppose I want to prove property P on all Exps . Just prove:

- $\forall n \in \text{Nat}, P(n)$
- $P(e) \rightarrow P(\mathbf{neg} \ e)$
- $P(e_1) \rightarrow P(e_2) \rightarrow P(\mathbf{add} \ e_1 \ e_2)$
